Interactive Features

NOTE: This manual incorporates several interactive features to provide supplemental information and ease of navigation. The information below is to aid in the identification and use of these features.

Hyperlinks

Hyperlinks provide direct access to a specific destination when clicked. The entire Table of Contents of this manual is hyperlinked to provide quick access to all sections of this manual when viewing the electronic version.

Hyperlinks within the content are denoted by blue, bold underlined text. Electronic format viewers can click these links for direct access to New Leader online features. Internet access is required.
Insert Current New Leader Warranty
PLEASE !  ALWAYS THINK SAFETY FIRST !!

The purpose of this manual is to familiarize the person (or persons) using this unit with the information necessary to properly install, operate, and maintain this system. The safety instructions indicated by the safety alert symbol in the following pages supersede the general safety rules. These instructions cannot replace the following: the fundamental knowledge that must be possessed by the installer or operator, the knowledge of a qualified person, or the clear thinking necessary to install and operate this equipment. Since the life of any machine depends largely upon the care it is given, we require that this manual be read thoroughly and referred to frequently. If for any reason you do not understand the instructions, please call your authorized dealer or our Product Sales and Support Department at 1-888-363-8006.

It has been our experience that by following these installation instructions, and by observing the operation of the spreader, you will have sufficient understanding of the machine enabling you to troubleshoot and correct all normal problems that you may encounter. Again, we urge you to call your authorized dealer or our Product Sales and Support Department if you find the unit is not operating properly, or if you are having trouble with repairs, installation, or removal of this unit.

We urge you to protect your investment by using genuine NLM parts and our authorized dealers for all work other than routine care and adjustments.

New Leader Manufacturing reserves the right to make alterations or modifications to this equipment at any time. The manufacturer shall not be obligated to make such changes to machines already in the field.

This Safety Section should be read thoroughly and referred to frequently.

ACCIDENTS HURT !!!

ACCIDENTS COST !!!

ACCIDENTS CAN BE AVOIDED !!!
Important Safety Information

Figure 1.1 - The need for safety cannot be stressed strongly enough in this manual. At New Leader Manufacturing, we urge you to make safety your top priority when operating any equipment. We firmly advise that anyone allowed to operate this machine carefully read, learn and understand all messages and information in this manual and on machine's safety decals before operating machine, as well as familiarize themselves with the location and function of all machine controls.

The following guidelines are intended to cover general usage and to assist you in avoiding accidents. There will be times when you will run into situations that are not covered in this section. At those times the best standard to use is common sense. If, at any time, you have a question concerning these guidelines, please call your authorized dealer or our Product Sales & Support Department at (800) 363-1771.

Safety Alert Symbols

TAKE NOTE! THIS SAFETY ALERT SYMBOL FOUND THROUGHOUT THIS MANUAL IS USED TO CALL YOUR ATTENTION TO INSTRUCTIONS INVOLVING YOUR PERSONAL SAFETY AND THAT OF OTHERS. FAILURE TO FOLLOW THESE INSTRUCTIONS CAN RESULT IN INJURY OR DEATH.

In this manual and on the safety signs placed on the unit, the words “DANGER,” “WARNING,” “CAUTION,” and “NOTICE” are used to indicate the following:

- **DANGER**: Indicates an imminently hazardous situation that, if not avoided, WILL result in death or serious injury. This signal word is to be limited to the most extreme situations and typically for machine components that, for functional purposes, cannot be guarded.

- **WARNING**: Indicates a potentially hazardous situation that, if not avoided, COULD result in death or serious injury, and includes hazards that are exposed when guards are removed. It may also be used to alert against unsafe practices.

- **CAUTION**: Indicates a potentially hazardous situation that, if not avoided, MAY result in minor or moderate injury. It may also be used to alert against unsafe practices.

- **NOTICE!**: Is used for informational purposes in areas which may involve damage or deterioration to equipment but generally would not involve the potential for personal injury.

**NOTE:** Provides additional information to simplify a procedure or clarify a process.
PREPARE FOR EMERGENCIES

Figure 1.2 - Be prepared if a fire starts. Keep a fully charged fire extinguisher and first aid kit in accessible place on the vehicle at all times.

Fire extinguisher must be Type ABC or Type BC.

Keep emergency numbers for doctors, ambulance service, hospital and fire department available at all times.

INSPECT HARDWARE BEFORE USE

Figure 1.3 - Inspect all bolts, screws, fasteners, keys, chain drives, body mounts and other attachments periodically. Immediately replace any missing or damaged parts immediately with proper specification parts.

Inspect spinner fins, spinner frame mounting and spinner fin hardware daily. Look for missing or loose fasteners, wear and cracks. Replace immediately if needed. Use only new SAE grade 5 or grade 8 screws and self-locking nuts.

Tighten all bolts, nuts and screws to specified torques. Refer to “Standard Torques” in Maintenance section of this manual.

HANDLE FLAMMABLE MATERIALS SAFELY

Figure 1.4 - Handle fuel and hydraulic oil with care. They are highly flammable.

Always stop the engine before refueling machine or filling hydraulic reservoir.

Never smoke while adding fuel or oil to machine. Add fluids in a safe place away from open flame and sparks.

Do not allow overflow. Clean up spilled fuel and oil immediately.

Always have a multipurpose dry chemical fire extinguisher filled and available during machine operation and when adding fuel. Know how to use it.
**General Safety Rules**

**Operations**

**HANDLE HAZARDOUS MATERIALS SAFELY**

Figure 1.5 - Materials to spread can be dangerous.

Improper selection, application, use or handling may be a hazard to persons, animals, plants, crops or other property.

A Safety Data Sheet (SDS) provides specific details on chemical products: physical and health hazards, safety procedures and emergency response techniques.

Check the SDS before starting any job using a hazardous material. Follow all instructions and precautions given by the material manufacturer.

**WORK IN WELL-VENTILATED AREAS**

![WARNING]

Never run machine engine inside a building unless adequate ventilation is provided to safely and properly remove exhaust fumes.

Figure 1.6 - Always work in a properly ventilated area.

Engine exhaust fumes can cause sickness or death. If it is necessary to run an engine in an enclosed area, use proper equipment to safely remove exhaust fumes from the working area.

Open building doors and get fresh air into the working area whenever possible.

**PROTECT AGAINST NOISE**

Figure 1.7 - Long periods of exposure to high decibels or loud noise can cause hearing impairment or loss.

Wear proper hearing protection during periods of exposure to high decibels or loud noise.

Wear a proper hearing protective device such as earmuffs or earplugs to protect against high decibels and / or uncomfortable loud noises.
GENERAL SAFETY RULES

AVOID MOVING PART HAZARDS

Figure 1.8 - Entanglement in rotating drive lines or moving parts will cause serious injury or death.

Stay clear of all moving parts, such as shafts, couplings and universal joints.

Make sure all personnel are clear of machine before starting.

Figure 1.9 - Do not operate machine without all guards and shields closed and secured. Disconnect and lock out power source before removing guards.

Disconnect and lock out power source before adjusting or servicing.

Keep hands, feet, hair and clothing away from moving parts.

Figure 1.10 - Keep away from spinners while they are turning.

Rocks, scrap metal and other material can be thrown from the spinners violently. Stay away from discharge area.

Stop machine before servicing or adjusting. Wear eye protection.

Make sure discharge area is clear before spreading.

Figure 1.11 - Stay out of the spreader.

If it is necessary to enter the spreader, return to the shop, empty body, turn off all power, engage brakes, shut down engine and remove keys before entering.

Tag all controls to prohibit operation. Tags should only be placed, and later removed, by the person working in the body.
General Safety Rules

Operations

DO NOT CLIMB OR STAND ON MACHINE

Figure 1.12 - Never allow any personnel to ride in or on the machine.

Use only inspection ladder or portable ladder to view the unit. Use caution when getting on and off the ladder, especially in wet, icy, snowy or muddy conditions. Clean mud, snow and ice from steps and footwear.

Always maintain three-point contact with steps, ladders and handholds. Face the machine when mounting and dismounting inspection ladder. Do not jump off the machine.

OPERATE MACHINE SAFELY

Always walk around and visually inspect the machine before using. Check immediate vicinity of machine for people and obstructions. Ensure adequate visibility.

Avoid distractions such as reading, eating or operating personal electronics that take your attention away from operating the machine. Never operate the machine under the influence of alcohol, drugs or while otherwise impaired.

Always come to a complete stop before reversing. Be sure that all personnel are clear of machine path. Turn around and look directly for best visibility. Ensure all rear view mirrors are properly installed and adjusted. Use a signal person when backing if view is obstructed or when in close quarters.

Always disengage hydraulics before shutting down engine. DO NOT start engine with hydraulics engaged.
**General Safety Rules**

**Transportation & Handling**

**TRAVELING & TRANSPORTING ON PUBLIC ROADS**

Always walk around and visually inspect the machine before traveling on public roads. Check for damage and/or faulty components that can fail and create a hazard or unsafe condition. Make sure all machine systems operate properly, including but not limited to: headlights, tail and brake lights, hazard warning lights, turn indicators, parking brake, horn and rear view mirrors. Repair or replace any component that is not in proper working order.

Never drive machine at a speed that causes it to bounce or cause loss of control.

Obey all traffic safety laws and regulations. Operate the machine with hazard warning lights on, unless prohibited by law. It is the operator’s responsibility to activate and use road lights properly while traveling on public roads.

Cover all loads that may spill or blow away. Environmental damage may result. Do not spread dusty materials where dust may create pollution, visibility issues or interfere with traffic on public roads.

When transporting equipment or machine on a trailer, ensure it is properly secured. Be sure that SMV signs on equipment or machine are covered while in transport on a trailer.

Be aware of overhead structures and power lines. Make sure machine can safely pass under. Refer to “Dimensions & Capacities” pages in the Operations section of this manual.

**NAVIGATING ROUGH & UNEVEN TERRAIN**

Figure 2.1 - Turn slowly and be careful when traveling on rough surfaces and side slopes. Avoid holes, ditches and obstructions that may cause machine to roll over, especially with a loaded spreader.

Never drive near the edge of a gully or steep embankment.

Load may shift, causing vehicle to tip.
General Safety Rules

Maintenance

READ AND UNDERSTAND MAINTENANCE PROCEDURES

Figure 3.1 - Read the maintenance and safety instructions and understand them before performing any maintenance procedure.

Never perform any maintenance procedure or repair if the instructions and safety procedures are not fully understood. Only trained and qualified personnel should perform any maintenance procedure or repair.

Never modify any equipment or add attachments not approved by New Leader Manufacturing.

DO NOT SERVICE OR ADJUST MACHINE WHILE IN MOTION

Figure 3.2 - Never lubricate, service or adjust the machine or any of its components while they are moving.

Never wear loose clothing or jewelry when working near machine tools or moving parts.

Remove rings and other jewelry to prevent electrical shorts and other personal injury when in contact with machine tools or moving parts.

Close and secure all guards removed for service. Check all screws, bolts, nuts and fasteners for proper torques before operating machine.

WEAR PROPER PROTECTIVE EQUIPMENT

Figure 3.3 - Wear close-fitting clothing and proper safety equipment for the job.

Always wear eye protection when working on or around the machine.

Wear a suitable hearing protection device such as earmuffs or earplugs to protect against high decibels or loud noises.

Prolonged exposure to high decibels or loud noise can cause hearing impairment or loss of hearing.

Wear protective gloves to protect hands from cuts, abrasions and minor burns.
HANDLE FLAMMABLE SOLVENTS SAFELY

Figure 3.4 - Never use diesel fuel, kerosene, gasoline or any flammable solvents for cleaning.

Perform work using flammable fluids and solvents in a safe place away from open flame and sparks. Do not smoke.

Do not weld, grind or flame cut on any tank containing oil, fuel, fumes or any other flammable material, or any container that contents or previous contents are unknown. Move all flammable materials and containers away from work area.

Clean up spilled fuel and oil immediately.

Always have a multipurpose dry chemical fire extinguisher filled and available. Know how to use it.

USE PROPER LIFTING EQUIPMENT

Figure 3.5 - Use only lifting devices that meet or exceed OSHA standard 1910.184 or ASME B30.20-2013.

Never lift equipment over people.

Never lift a loaded unit. Never lift unit with any loose objects or persons in the body. Loads may shift or fall if improperly supported, causing death, serious injury or machine damage.

Before unfastening heavy parts or assemblies, support with adequate hoist or other device to prevent falling, tipping, swinging or any other movement that may cause injury or damage.

USE PROPER TOOLS FOR THE JOB

Figure 3.6 - Use of improper tools (such as a screwdriver instead of a pry bar, pliers instead of a wrench, a wrench instead of a hammer) can cause serious injuries or machine damage.

Use power tools only to loosen threaded parts and fasteners. Using power tools to tighten may cause over-tightening and component damage.

Use only service parts meeting New Leader specifications.
HIGH PRESSURE FLUID HAZARDS

Figure 3.7 - Escaping fluid under pressure can penetrate the skin causing serious injury.

Always stop machine, allow to cool and relieve pressure before servicing hydraulic system. Never open hydraulic lines under pressure. Make sure all connections are tight and all hoses are in good condition before pressurizing system.

Always use a piece of cardboard or wood to search for leaks instead of hand. Wear impervious gloves and eye protection when servicing system.

Seek medical attention immediately if fluid penetrates your skin. Gangrene may result if wound is left untreated.

AVOID HEATING NEAR HIGH PRESSURE FLUID LINES

Figure 3.8 - Flammable spray can be generated by heating near pressurized fluid lines, resulting in burns to yourself and bystanders.

Do not heat by welding, soldering or using a torch near pressurized fluid lines or other flammable materials.

Pressure lines can suddenly burst when heat goes beyond the immediate flame area.

AVOID TOXIC FUMES & DUST

Figure 3.9 - Hazardous fumes can be generated when paint is heated from welding, soldering or using a torch.

Remove paint before heating:
• Remove a minimum of 4 in (100mm) from area to be affected by heating. If paint cannot be removed, wear an approved respirator while heating or welding.
• Avoid breathing dust from sanding or grinding on paint.
• If a solvent or paint stripper is used, wash stripper away with soap and water before heating or welding. Remove solvent or paint stripper containers and other flammable material from area. Allow fumes to disperse for at least 15 minutes before heating or welding.

Do not use chlorinated solvents in areas where welding will take place.

Perform all work in a well-ventilated area that will carry all toxic fumes and dust away.
General Safety Rules

Maintenance

CLEAN MACHINE OF HAZARDOUS CHEMICALS

⚠️ CAUTION
During application of hazardous chemicals, residue can build up on the inside or outside of the vehicle. Clean vehicle according to use instructions of hazardous chemical.

Figure 3.10 - When exposed to hazardous chemicals, clean exterior and interior of vehicle daily to keep free of the accumulation of visible dirt and contamination.

1. Clean operator’s station to maintain unobstructed visibility of all windows and mirrors, and safe operation of all controls.

⚠️ NOTICE!
Directing pressurized water at electronic/electrical components, bearings and hydraulic seals or other sensitive parts and components may cause product malfunctions. Reduce pressure and spray at 45 to 90 degree angles.

2. Wash entire exterior of vehicle.
3. Dispose of any wash water with hazardous concentrations of active or non-active ingredients according to published regulations or directives.

HANDLE BATTERIES SAFELY

⚠️ WARNING
Sulfuric acid in battery electrolyte is poisonous. It can burn skin, eat holes in clothing, and cause blindness if it contacts eyes.

Figure 3.11 - Lead acid batteries generate flammable and explosive gases. Keep sparks and flame away from batteries. Do not smoke.

If acid contacts eyes, skin or clothing, flush with water immediately. Seek immediate medical attention if acid contacts eyes.

PROPER TIRE MAINTENANCE

Figure 3.12 - Never weld on a wheel or rim that has a tire on it.

Never attempt to mount or remove a tire unless using the proper equipment, tire safety cage, instructions, training, and you are qualified to perform the work safely. Failure to follow the correct procedures when mounting a tire on a wheel or rim can cause an explosion and serious injury.

Tire service procedures must be performed by trained and qualified personnel.
Storage

PARK VEHICLE SAFELY

Figure 4.1 - When leaving the vehicle unattended for any reason, be sure to:

- Shut down PTO.
- Shut off vehicle’s engine, and unit’s engine if applicable.
- Place vehicle transmission in “Neutral” or “Park”.
- Set parking brake firmly.
- Remove ignition key and take it with you.
- Block wheels.

These actions are recommended to avoid unauthorized use, runaway, vandalism, theft and unexpected operation during startup.

SUPPORT MACHINE PROPERLY

Figure 4.2 - When machine is removed from vehicle, always store on adequate supports on a firm level surface. Improper supporting or storage of spreader may cause machine to fall, resulting in serious injury or death.

Never use lifting device to free machine from a chassis, storage stands or frozen ground, or to lift the chassis in any way. Shock loading is prohibited and sudden accelerations must be avoided. Lifting in such a manner could result in injury or machine damage.

DISPOSE OF WASTE PROPERLY

Figure 4.3 - Improper disposal of waste can threaten the environment and ecology. Potentially harmful waste used with equipment include items such as fuel, oil, filters and batteries.

Use leakproof containers when draining fluids. Do not use food or beverage containers that may mislead someone into drinking from them. Do not pour waste onto the ground, down a drain, or into any water source.

Inquire on proper disposal methods from your local environmental or recycling center, or from your local dealer.
Safety Decals

Safety Decal Maintenance

Keep safety decals and signs clean and legible at all times.

Replace safety decals and signs that are missing or have become illegible.

Replaced parts that displayed a safety sign should also display the current sign.

Safety decals or signs are available from your dealer’s Parts Department or from New Leader Manufacturing by calling (800) 363-1771.

Safety Decal Installation

Clean Surface
Wash the installation surface with a synthetic, free-rinsing detergent. Avoid washing the surface with a soap containing creams or lotion. Allow to dry.

Position Safety Decal
Decide on the exact position before application. Application marks may be made on the top or side edge of the substrate with a lead pencil, marking pen, or small pieces of masking tape. NOTE: Do not use chalk line, china marker, or grease pencil. Safety decals will not adhere to these.

Remove the Liner
A small bend at the corner or edge will cause the liner to separate from the decal. Pull the liner away in a continuous motion at a 180-degree angle. If the liner is scored, bend at score and remove.

Apply Safety Decal
Tack decal in place with thumb pressure in upper corners. Using firm initial squeegee pressure, begin at the center of the decal and work outward in all directions with overlapping strokes. NOTE: Keep squeegee blade even—nicked edges will leave application bubbles. Pull up tack points before squeegeeing over them to avoid wrinkles.

Remove Pre-mask
If safety decal has a pre-mask cover remove it at this time by pulling it away from the decal at a 180 degree angle. NOTE: It is important that the pre-mask covering is removed before the decal is exposed to sunlight to avoid the pre-mask from permanently adhering to the decal.

Remove Air Pockets
Inspect the decal in the flat areas for bubbles. To eliminate the bubbles, puncture the decal at one end of the bubble with a pin (never a razor blade) and press out entrapped air with thumb moving toward the puncture.

Re-Squeegee All Edges
1. CAUTION: TO AVOID INJURY OR MACHINE DAMAGE:
   - Do not operate or work on this machine without reading and understanding the operator’s manual.
   - Keep hands, feet, hair and clothing away from moving parts.
   - Do not allow riders on machine.
   - Avoid unsafe operation or maintenance.
   - Disengage power takeoff and shut off engine before removing guards, servicing or unclogging machine.
   - Keep unauthorized people away from machine.
   - Keep all guards in place when machine is in use.
   - If manual is missing, contact dealer for replacement.

2. DANGER: MOVING PART HAZARD
   To prevent death or serious injury:
   - Stay out of box while conveyor is moving.
   - Disconnect and lockout power source before adjusting or servicing.
   - Do not ride on the spreader.

3. CAUTION: HAZARDOUS MATERIALS
   To avoid injury or machine damage:
   - Materials to be spread can be dangerous.
   - Improper selection, application, use or handling may be a hazard to persons, animals, crops or other property.
   - Follow instructions and precautions given by the material manufacturer.

3A. WARNING: HAZARDOUS MATERIALS
   To avoid injury:
   - Cancer and Reproductive Harm - www.P65Warning.ca.gov
4. **WARNING: HIGH-PRESSURE FLUID HAZARD**
   **To prevent death or serious injury:**
   - Do not check leaks with hands while system is operating as high pressure oil leaks can be dangerous!
   - Relieve pressure before disconnecting hydraulic lines or working on system.
   - Make sure all hydraulic fluid connections are tight and all hydraulic hoses and lines are in good condition before applying pressure to the system.
   - Wear protective gloves and safety glasses or goggles when searching for leaks. Use wood or cardboard instead of hands.
   - Do not use hydraulic lines for hand holds or steps.
   - Components may be hot.
   - Get immediate medical attention if skin is pierced with fluid as gangrene may result.

5. **WARNING: MOVING PART HAZARD**
   **To prevent death or serious injury:**
   - Close and secure guards before starting.
   - Do not stand or climb on machine.
   - Disconnect and lockout power source before adjusting or servicing.
   - Keep hands, feet and hair away from moving parts.

6. **WARNING: FALLING HAZARD**
   **To prevent death, serious injury or machine damage:**
   - Do not stand or climb on guard.
7. DANGER: GUARD IS MISSING WHEN THIS IS VISIBLE
To prevent death or serious injury:
- Do not operate this unit without guard in place.

8. DANGER: FLYING MATERIAL AND ROTATING SPINNER HAZARD
To prevent death or serious injury:
- Wear eye protection.
- Stop machine before servicing or adjusting.
- Keep bystanders at least 60 feet away.

9. DANGER: PINCH POINT HAZARD
To prevent death or serious injury:
- Keep all persons and objects clear while any part of this machine is in motion.
- Keep hands, feet, hair and clothing away from moving parts.
1. NOTICE: SPREAD PATTERN TESTING
   To obtain optimal machine performance:
   Before spreading material, spread pattern tests must be conducted to properly adjust the spread pattern. Refer to the manual for adjustment instructions. A spread pattern test kit is available from your New Leader dealer.

   Wind, humidity, rain and other adverse weather conditions can affect spread pattern, resulting in uneven crop growth and loss of yields.

   THE MANUFACTURER OF THIS SPREADER WILL NOT BE LIABLE FOR MISAPPLIED MATERIAL DUE TO AN IMPROPERLY ADJUSTED SPREADER OR ADVERSE WEATHER CONDITIONS.

   It is recommended that spread pattern tests be conducted prior to each spreading season, after any spreader maintenance, and periodically during the spreading season. Spread pattern tests must be conducted whenever a new product is to be applied.

2. NOTICE: CONVEYOR CHAIN LUBRICATION
   To avoid machine damage and premature wear:
   - Conveyor chain life will be noticeably extended by periodic lubrication.
   - Use a 75% diesel fuel and 25% number 10 oil mixture on the links and rollers.
   - Failure to keep the chain links loose and free running can result in severe damage to the conveyor chain, drag shaft, gear case, body structure, and is cause for voiding the warranty.

3. NOTICE: CONVEYOR CHAIN TENSION
   To avoid machine damage and premature deterioration:
   - Periodically inspect conveyor chain tension to ensure proper tension is maintained.
   - See “Lubrication & Maintenance” section of this manual for details.

4. NOTICE: MACHINE LUBRICATION
   To avoid machine damage and premature deterioration:
   - Periodically lubricate the machine components at the front and rear remote grease banks.
   - See “Lubrication & Maintenance Chart” in this manual for details.

5. NOTICE: DO NOT SPREAD HERBICIDE
   To avoid machine damage:
   - This unit is intended for dispensing micronutrients and seeds only--NOT HERBICIDES.
   - The manufacturer is not liable for damage resulting in proper use.
Recommended sequence of installation is:
1. Mounting of spreader.
2. Installation of chassis hydraulic hose and electrical wiring to spreader.
3. Installation of optional parts.
4. Initial lubrication.
5. Checking for leaks and proper functioning.

Lifting the Spreader

**WARNING**

Use only lifting devices that meet or exceed OSHA standard 1910.184 or ASME B30.20-2006. Never lift equipment over people. Never lift unit with anything or anybody in the body. Loads may shift or fall if improperly supported, causing damage to unit, injury or even death.

**CAUTION**

Do not use lifting device to free unit from a chassis, storage stands or frozen ground, or to lift the chassis in any way. Shock loading is prohibited and sudden accelerations should be avoided. Lifting in such a manner could result in damage to unit or injury.

Always inspect unit lift points for signs of wear, cracking, corrosion, gouges, alterations, or distortion.

Always use a sling, spreader bar, or lifting bar that attaches to the lifting points with a minimum of 60 degrees from horizontal. It is preferable to use an “H” style lifting bar that keeps the attaching chains in a near vertical orientation as shown in Figure 1. Operators of lifting devices must be qualified and knowledgeable in their use and application.

Position the chassis with adequate room around the unit. Work in an environment that permits clear communication to others nearby. Keep area clear of persons when loads are to be lifted and suspended. Do not allow the lifted load to come in contact with any obstruction.

Store units on a solid surface using appropriate storage stands when not installed.

Figure 1 - Lifting Bar
Installing Body

**NOTICE!** DO NOT WELD ON VEHICLE FRAME! Such welding can lead to fatigue cracking and must be avoided.

**NOTICE!** Connect welders ground directly to one of the items being welded anytime an arc welder is used on the vehicle or anything connected to the vehicle. Refer to Manufacturer’s instructions.

**IMPORTANT!** Disconnect electrical components from electrical system when welding on equipment to prevent component damage due to power surges or excessive current.

**Mounts**

**CAUTION** Refer to chassis operator’s manual for specific procedures on tightening mounting hardware. Failure to follow procedure per chassis manufacturer may result in injury or machine damage.

Position unit over chassis and align mounts. Carefully lower unit onto chassis. Install mounting hardware and tighten to specified torque. Refer to chassis operator’s manual for specific hardware tightening procedures.

**Hydraulic Hose Installation**

**CAUTION** If a threaded connection is tightened too tightly, the fitting or housing into which the fitting is placed could be distorted and an unstoppable leak could occur.

**WARNING** Do not use one manufacturer’s hose with another manufacturer’s fittings! Such will void any warranty and may cause premature burst or leak of hydraulic fluids! Severe injury and/or fire could result!

Locate zero pressure case drain port on chassis. Connect this hose to chassis first. Next connect return hose to return port. Connect pressure hose to pressure port last. Use plastic tie straps as necessary to support hoses so they will not catch on field obstructions or contact hot or moving parts.

**Figure 2 - Chassis Hydraulic Connections:**

A: Main Bin Pressure  
B: Main Bin Return  
C: Case Drain  
D: Insert Bin Pressure*  
E: Insert Bin Return*

* - Only used if optional MultiApplier or MultiBin is installed.
# Hydraulic Hose Installation Guide

1. Use elbows and adapters in the installation to relieve strain on the assembly, and to provide easier and neater installations that are accessible for inspection and maintenance. Remember that metal end fittings cannot be considered as part of the flexible portion of the assembly.

2. Install hose runs to avoid rubbing or abrasion. Clamps are often needed to support long runs of hose or to keep hose away from moving parts. It is important that the clamps be of the correct size. A clamp that is too large will allow the hose to move in the clamp causing abrasion at this point.

3. In straight hose installations allow enough slack in the hose line to provide for changes in length that will occur when pressure is applied. This change in length can be from +2% to -4%.

4. Do not twist hose during installation. This can be determined by the printed layline on the hose. Pressure applied to a twisted hose can cause hose failure or loosening of the connections.

5. Keep hose away from hot parts. High ambient temperature will shorten hose life. If you cannot route it away from the heat source, insulate it.

6. Keep the bend radii of the hose as large as possible to avoid hose collapsing and restriction of flow. Follow catalog specs on minimum bend radii.

(Used with the permission of The Weatherhead Company.)
**Electrical Connections**

Connect all electrical control circuits. All wiring should be approved automotive insulated wire, supported adequately with insulating ties or straps, and located where it will not interfere with any control or access. Make sure wiring does not contact any moving parts or sharp edge and is kept away from any hydraulic lines or any heated part.

**Chassis Connections**

A: Power Connections - Connect ITT Cannon connectors of spreader power harness.

B: ISOBUS Connection - Connect 35 pin connector of spreader ISOBUS harness.

C: Lighting Connection - Connect 31 pin connector of spreader lighting harness.
Recommended sequence of installation is:
2. Insert preparation.
5. Installation of hillside divider and conveyor cover.
6. Checking installation.
7. Checking for leaks and proper functioning.

**Spreader Preparation**

Use only lifting devices that meet or exceed OSHA standard 1910.184. Never exceed work load limits or lift equipment over people. Empty spreader before lifting. Loads may shift or fall if improperly supported, causing injury.

WARNING

Remove the Inverted “V”, Hillside Divider and side boards from the spreader, if so equipped, and set hardware aside. Replace chain shield hardware from Hillside Divider and torque to spec.

Remove Feedgate Jack Handle and set aside. Support endgate by attaching a hoist to the lift hooks. Remove hardware from both sides of the endgate and carefully remove from the spreader as shown in Figure 1.

NOTE: Always use a sling, spreader bar, or lifting bar that attaches to the lifting points with a minimum of 60 degrees from horizontal. It is preferable to use a straight style lifting bar that keeps the attaching chains in a near vertical orientation.

NOTE: Always inspect unit lift hooks for signs of wear, cracking, corrosion, gouges, alterations, or distortion before use.
Feedgate Adjustment

**WARNING**
Stay out of the spreader. If it’s necessary to enter the spreader, return to the shop, empty body, turn off all power, set vehicle brakes, lock engine starting switch and remove keys before entering. Tag all controls to prohibit operation. Tags should be placed, and later removed, only by person working in the body.

Adjust the insert’s front feedgate prior to installation.

![Figure 2](image1)
![Figure 3](image2)

To adjust main bin’s feedgate opening, position front feedgate on insert as necessary to achieve a 1-1/2 inch (3.81 cm) (Figure 2) to 4 inch (10.16 cm) (Figure 3) opening in 1/2 inch increments.

**NOTE:**
Visit newleader.highwayequipment.com/calculators/yield-output and enter parameters to determine minimum and maximum application rates and feedgate openings for optimal performance of your spreader.
Insert Installation

Before installing the insert:

**Parts Needed:**

<table>
<thead>
<tr>
<th>Description</th>
<th>Qty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert Unit</td>
<td>1</td>
</tr>
<tr>
<td>Capscrew - 1/2 x 1 1/4 Grade 8</td>
<td>8</td>
</tr>
<tr>
<td>Flat Washer - 1/2 Grade 8</td>
<td>16</td>
</tr>
<tr>
<td>Lock Washer - 1/2 Grade 8</td>
<td>8</td>
</tr>
<tr>
<td>Hex Nut - 1/2 Grade 8</td>
<td>8</td>
</tr>
</tbody>
</table>

Make sure rubber sealer hardware is loose. If not, loosen.

![Figure 4A](image1)

**Figure 4A**

To install insert bin:

- Figure 4A - Hoist and slide insert into position between main bin’s side sheets.
- Figure 4B - Align front and rear mount brackets.
- Make sure insert is resting on inside of main bin, and not resting on tops of side sheets.
- Release tension on hoist but do not remove.

![Figure 4B](image2)

**Figure 4B**

---

**WARNING**

Use only lifting devices that meet or exceed OSHA standard 1910.184. Never exceed work load limits or lift equipment over people. Empty spreader before lifting. Loads may shift or fall if improperly supported, causing injury.

---

www.NewLeader.com
(800) 363-1771
Figures 5A-5B - Visually make sure insert is centered from side to side in main bin and rear pads are resting on main bin.

Figure 6 - There must be contact between rear pads and main unit. Check for contact by trying to slide paper between pads and main bin. If no contact, adjust insert.

Figure 7 - Inside main unit, locate front pads by lifting rubber sealers on front endgate.
Figures 8A-8B - There must be contact between front pads and main bin. Check for contact by trying to slide paper between pads and main bin. If no contact, adjust insert.

NOTE: Pry insert at mount brackets if necessary.

Figure 9 - Once both front pads make contact, insert hardware in front mount brackets’ lower holes. Shim between main bin and insert brackets if distance is larger than 1/8” (.32cm). Tighten hardware per torque recommendations in this manual.

Figure 10 - Make sure front feedgate is level. Lower endgate sealers so flush with chain shields and tighten hardware.

**NOTICE!** Leakage of material may occur if the sealer belts are not set properly on the front of the insert. Highway Equipment Company is not liable for lost material due to improperly installed sealer belts.

Figure 11 - Make sure there is a complete seal covering the gap between the insert and the main bin’s side sheets. Tighten all hardware on rubber sealers at front of insert.

Make sure rear pads are still in place against main bin. Install hardware in lower holes of rear mount brackets. Shim between main bin and insert brackets if distance is larger than 1/8” (.32cm). Tighten hardware per torque recommendations in this manual.

Make sure insert’s side sheets are not resting on top of main bin’s side sheets.

Install hardware in all four mount brackets’ upper holes. Tighten hardware per torque recommendations.

Remove hoist.

Inspect unit for foreign debris in conveyor area.

**MULTIBin** only - Inspect unit for foreign debris in meter wheel area.
Insert Installation

Lower Divider - Multibin

The following steps apply to Multibin units only. Continue to “Hydraulics” for Mutapplier units.

NOTICE! Highway Equipment Company will not be liable for misapplied material due to an improperly adjusted divider, spreader or both.

Parts Needed:

<table>
<thead>
<tr>

<td>4</td>
</tr>
</tbody>
</table>

Figure 12 - Make sure center fin is square to rear panel.

Figure 13 - Measure distance between Lower Divider fins to make sure they are all 3” (8cm) apart. Adjust top of fin as necessary.

Figure 14 - Slide Lower Divider between bottom of Multibin and Spinner Divider as shown.

Figure 15 - Lift Lower Divider to bottom of Multibin, align holes and loosely install front and rear hardware.
Figure 16 - Verify Lower Divider is square by measuring from each side to main bin’s chain shields. Make sure distances are equal.

Make sure Lower Divider is centered over Material Divider. Contact Highway Equipment Company if they cannot be aligned.

Tighten front and rear hardware per torque recommendations. Refer to “Standard Torques” in the “Lubrication and Maintenance” section of the spreader manual.

**Hydraulics**

Attach insert hoses to spreader hoses as shown in Figures 17A - 17C as applicable.
Hydraulic Installation

Refer to “Installation Guide” for proper hydraulic hose installation guidelines.

If insert was purchased separately from spreader, refer to parts pages for hydraulic installation. Install valve mounting bracket on two right hand front stakes as shown in Figure 18 (MULTIBIN installation shown).
Hillside Divider & Conveyor Cover - MultiApplier

The following steps apply to MultiApplier units only. Continue to “Micro Cover Installation” for MultiBin units.

NOTICE! Highway Equipment Company will not be liable for misapplied material due to an improperly adjusted divider, spreader or both.

Loosen hardware from rear two chain shield holes on each side of MultiApplier. Install MultiApplier Hillside Divider (A) and fasten to Support using single bin Hillside Divider hardware removed before MultiApplier installation (B). Adjust Hillside Divider so that the middle divider is centered over both conveyors and the Material Divider (C) as shown in Figure 19. Tighten all hardware to recommended torque.

Figure 19A - MultiApplier Hillside Divider

</tr>
</tbody>
</table>

Figure 19B - MultiApplier Dual Conveyor Cover
**Insert Installation**

**Electrical Connections**

Connect all electrical control circuits. All wiring should be approved automotive insulated wire, supported adequately with insulating ties or straps, and located where it will not interfere with any control or access. Make sure wiring does not contact any moving parts or sharp edges and is kept away from hydraulic lines and heated parts.

Plug in Encoder.

Locate the gray insert bin detection receptacle and the black lanyard receptacle hanging in-line on ISOBUS harness, near the 35 pin chassis connector.

When an insert bin is installed, the gray detection loop plug must be installed in the gray insert detection receptacle. Install the black plug into the black lanyard receptacle for storage.

Refer to “Controller” parts pages for illustrations of master/slave control modules.

**Micro Cover Installation**

**Air Supply and Electrical Requirements**

<table>
<thead>
<tr>
<th>Auxiliary Supply Line</th>
<th>Electrical Connections</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry Air - 85 PSIG (5.86 Bar)</td>
<td>Red = 12 V (+)</td>
</tr>
<tr>
<td></td>
<td>Black = Ground (-)</td>
</tr>
</tbody>
</table>

Refer to “MultiBin Lid Pneumatics” in the spreader parts manual for air line connections.

Make sure all hardware on insert is torqued before installing cover.

**WARNING**

Pressurized air may cause sudden movement of parts. Do not service cover components until safety precautions have been performed. Take preventative measures to prevent falling or runaway of cylinder or mechanism before maintenance and restart of spreader. Exhaust all residual air and cut the pressure supply for components before servicing. Injury can occur if precautions are not taken.

**WARNING**

Open cover lid with air prior to removing actuator pin and block cover lid to prevent closing. Unintentional closing could cause injury.

Fasten a three-point lifting device to two lift hooks and one hole in guide mount as shown in Figure 20. Hoist cover onto MultiBin as shown in Figure 21. Align slots and attach hardware. Tighten to recommended torque. Secure fittings and airline tubing on MultiBin with wire ties as shown in Figure 22. Connect to air and electrical systems. Open lid and install additional hardware inside cover. Install screens.

Refer to “Air Schematic” page in the Troubleshooting section for air supply requirements.
Insert Removal/Endgate Installation

Remove insert and reinstall endgate, Inverted “V”, single conveyor Hillside Divider, etc. by following applicable installation instructions in reverse order. Make sure the insert hydraulics, electrical connections and air lines are disconnected from the spreader before removal. See “Inverted V” in spreader parts manual.
Insert Installation

Hydraulics Removal

Route hydraulic hoses on the spreader and the insert as shown in Figures 23A - 23C as applicable.

Figure 23A - Detach MULTAPLIER

Figure 23B – Detach MULTIBin Dual Micro

Figure 23C – Detach MULTIBin Single Micro
The Case IH NL4500G4 EDGE Trident is a hopper type spreader intended for spreading free flowing granular agricultural materials, such as chemical fertilizers, agricultural limestone, and gypsum. It is intended for mounting on the Case IH 5550 Trident - a high-clearance post-emergence application vehicle.

The unit is hydraulically powered and provides independent variable speed control for the spinner and full automatic ground speed control for the conveyor.

The conveyor delivers material to the spinners through an adjustable metering gate at the rear of the hopper body. An orbital type hydraulic motor mounted to a 6-to-1 ratio spur gear case drives the conveyor. The conveyor is a 30-inch (76cm) wide #4 belt-over-chain (BOC) type conveyor consisting of parallel strands of pintle chain joined by crossbars every other link. Moderately oil-resistant (MOR) belting is fastened to the top side of the conveyor at each crossbar.

The spinner assembly has two 24-inch (61cm) diameter dished discs. Each disc has four formed and heat treated fins that are adjustable to radial angle. The spinner is fully adjustable by means of a rotating handle.

The optional 304 stainless steel hopper style spreader MultiApplier or MultiBin may be inserted in the main bin.

- Inserting the MultiApplier allows for two separate materials to be spread simultaneously. It features a 24-inch (61cm) wide #4 belt-over-chain type conveyor consisting parallel strands of pintle type chain joined by crossbars every other link. Moderately oil-resistant belting is fastened to the conveyor at each crossbar. The direct-driven conveyor is also controlled independently enabling the delivery of material at variable rates through the adjustable gate at the rear of the hopper body. The hillside divider improves material placement on the spinner for a more effective spread pattern.

- Inserting the MultiBin will convert the spreader to a 3 or 4 hopper unit, which can be used independently or together for straight and variable rate applications. The front two hoppers dispense fertilizer products while the single or dual hopper at the rear dispense(s) micronutrients or seeding products. The rear bin(s) are sloped forward to improve chassis weight distribution. Material is delivered from the front bins by conveyor through adjustable metering gates. The rear bin(s) deliver material through a meter wheel system. Bin sensors are installed in all bins to warn when materials are low in each micronutrient bin.

The MultiBin also comes equipped with an upper and lower material divider which improves material placement on the spinner for a more effective spread pattern.

An optional micronutrient stainless steel cover which opens and closes with a stainless steel air cylinder is available.

Screens installed on micronutrient bins keep large chunks of material out of the bins by breaking the material up as it enters the bins.

The optional 304 stainless steel MultiApplier may be inserted in the main bin at any time. This product is intended for commercial use only.

313974-AA-B
Introduction

Bin 1: Main holding bin for material or Insert. MultiApplier and MultiBin inserts (shown on following pages) are configured as Bins 2-4 depending on type used.

Conveyor: Conveys material to rear of unit.

Conveyor Chain Oiler: Use to lubricate conveyor chain strands at the end of each day’s use to prevent premature component failure.

Enclosure: Houses spreader control modules and fuse panel.

Feedgate: Adjustable gate mounted into Rear Endgate. Allows for variable rates of material flow by adjusting jack to desired height.

Hillside Divider: Ensures balanced flow of material across conveyor when on hillsides or uneven terrain.

Hydraulic Valve Assembly: Contains control valves for Bin 1 conveyor, spinners and automatic conveyor tension.

Inverted “V”: Mounted inside Main Hopper when Insert not installed. Distributes weight pressure across conveyor, allowing for consistent material flow to Feedgate, and promotes an improved blend when spreading fertilizer.

Lift Hooks: Used to lift unit or insert with appropriately rated lifting device.

Material Divider: Ensures uniform spread pattern by directing material off of conveyor onto spinner discs.

Material Divider Back Plate Storage: Storage position for material divider back plate when removed for spreading lime.

Rear Endgate: Welded or bolt-in endgate (depending on model) furthest from chassis cab (Rear based on direction of travel). Holds mounted Feedgate, allowing for rear release of material from bin.

Sight Window: Allows viewing into Bin 1 from remote location, such as from ground or from vehicle cab.

Sill: Base of Main Hopper side walls. Contains Conveyor and supports machine walls.

Spinner Assembly: Contains adjustable G4 Spreader system, consisting of hydraulic spinners used for dispersal of various materials at different positioned settings allowing for consistent, even spread patterns across a wide variety of material with a high rate of accuracy.

Spinner Deflectors: Deflect material away from machine.

Spinner Guards: Upper and Lower guards, protects operators from spinner discs. Must be in place during any operation.

Side Stake: Side support for machine walls.

Sub frame: Supports body, attaches to Chassis frame. Transfers weight from Main Hopper to Chassis.

**Initial Start-Up**

**WARNING**  Stand clear of moving machinery.

**NOTE:**  Do not load spreader with material.

1. Check entire unit to make sure all fasteners are in place and properly tightened per “Standard Torques” section in this manual.
2. Make sure no other persons are in vicinity of spreader.
3. Make sure no loose parts are in unit or on conveyor or spinner.
4. Start engine and turn on hydraulics. Allow hydraulics to circulate until oil is warm.
5. Run spinner at 300 RPM. Allow to run until spinner is operating smoothly and all air has been purged from system.
6. Run conveyor at 20 RPM and spinner at 300 RPM. Run until conveyor is operating smoothly.
7. Run conveyor at 20 RPM and spinner at 700 RPM. Allow both conveyor and spinner to run until operating smoothly.
8. Enable boundary left and right and verify that RPM adjust accordingly.
9. Run conveyor at 0 RPM and spinner at 0 RPM. Make sure both conveyor and spinner do not move.
10. Verify spreader calibration as defined in the manual for the controller that is supplied with your machine.
11. Shut system down.

---

**WARNING**

DO NOT check leaks with hands while system is operating as high pressure oil leaks can be dangerous! If skin is pierced with hydraulic fluid at high pressure seek immediate medical attention as fluid injected into the skin could cause gangrene if left untreated. Relieve pressure before disconnecting hydraulic lines or working system. Make sure all hydraulic fluid connections are tight and all hydraulic hoses and lines are in good condition before applying pressure to the system. Wear protective gloves and safety glasses or goggles when working with hydraulic systems.

---

**WARNING**

DO NOT check for leaks adjacent to moving parts while system is operating as there may be danger of entanglement!

---

12. Check all connections in hydraulic system to make sure there are no leaks.

Unit is now ready for field testing.
General Operating Procedures

1. Make sure unit has been properly serviced and is in good operating condition. It is recommended to run the spreader prior to loading material to ensure acceptable operation.
2. Set manual machine settings in controller per Controller section in this manual.
3. Program controller with correct data for material and application.
4. Adjust feedgate to appropriate setting.
5. Adjust spinner to give spread pattern desired. See “Spread Pattern” and “Controller” sections for details. Calibrate and spread pattern test for any new material.
6. Fill unit with material to be spread.
7. Engage hydraulics.
8. Begin spreading.

⚠️ CAUTION   Drive only at speeds which permit good control of vehicle!
This page is intentionally left blank.
Preventative Maintenance Pays!

The handling and spreading of commercial fertilizers is a most severe operation with respect to metal corrosion. Establish a frequent, periodic preventative maintenance program to prevent rapid deterioration to spreading equipment. Proper cleaning, lubrication and maintenance will yield longer life, more satisfactory service and more economical use of your equipment.

**WARNING** Shut off all power and allow all moving parts to come to rest before performing any maintenance operation.

Hydraulic System

Proper oil in the hydraulic system is one of the most important factors for satisfactory operation. **Utmost cleanliness** in handling the oil cannot be stressed enough. Keep hydraulic oil in original closed containers, clean top of container before opening and pouring, and handle in extremely clean measures and funnels.

Check hydraulic oil level and filter condition regularly.

Refer to “Lubricant and Hydraulic Oil Specifications” for selection of the proper hydraulic fluid for use in the hydraulic system.

**WARNING** DO NOT check leaks with hands while system is operating as high pressure oil leaks can be dangerous! If skin is pierced with hydraulic fluid at high pressure seek immediate medical attention as fluid injected into the skin could cause gangrene if left untreated. Relieve pressure before disconnecting hydraulic lines or working system. Make sure all hydraulic fluid connections are tight and all hydraulic hoses and lines are in good condition before applying pressure to the system. Wear protective gloves and safety glasses or goggles when working with hydraulic systems.

**WARNING** DO NOT check for leaks adjacent to moving parts while system is operating as there may be danger of entanglement!

Periodically inspect hydraulic hoses and fittings for leaks. Repair and replace components as necessary.

**NOTICE!** Because the hydraulic reservoir is part of the vehicle chassis rather than the spreader box, hydraulic filter indicator, oil level and oil temperature displayed on the ISOBUS controller are not indicative of actual oil condition. Refer to chassis operator’s manual for details.
Hydraulic Hose

Hose assemblies in operation should be inspected frequently for leakage, kinking, abrasion, corrosion or other signs of wear or damage. Worn or damaged hose assemblies should be replaced immediately. When replacing, use hoses of same or better rating and construction.

WARNING Testing should be conducted in approved test stands with adequate guards to protect the operator.

Clean
Clean assembly by blowing out with clean compressed air. Assemblies may be rinsed out with mineral spirits if the tube stock is compatible with oil, otherwise hot water at 150°F (65.55° C) maximum may be used. Ensure all are dry before assembly.

Inspect
Examine hose assembly internally for cut or bulged tube, obstructions, and cleanliness. For segment style fittings, be sure that the hose butts up against the nipple shoulder; band and retaining ring are properly set and tight, and segments are properly spaced. Check for proper gap between nut and socket or hex and socket. Nuts should swivel freely. Check the layline of the hose to be sure the assembly is not twisted. Cap the ends of the hose with plastic covers to keep clean.

Test
The hose assembly should be hydrostatically tested at twice the recommended working pressure of the hose. Test pressure should be held for not more than one minute and not less than 30 seconds. When test pressure is reached, visually inspect hose assembly for: 1. Any leaks or signs of weakness. 2. Any movement of the hose fitting in relation to the hose. Any of these defects are cause for rejection.

Storage and Handling
Hose should be stored in a dark, dry atmosphere away from electrical equipment, and the temperature should not exceed 90° F (32.22° C).

Conveyor Chain

WARNING Stay out of the hopper body. If it’s necessary to enter the hopper, return to the shop, empty body, turn off all power, set vehicle brakes, lock engine starting switch and remove keys before entering. Tag all controls to prohibit operation. Tags should be placed, and later removed, only by person working in the body.

Hose down unit and remove any material build-up on sprockets and under chain.

NOTICE! The conveyor will move away from the bottom panel if material accumulates under the conveyor or on the sprockets. The more material that accumulates, the closer the chain will come to the chain shields. If the conveyor should catch a chain shield, it could permanently damage the conveyor, the chain shields or the unit. Do not remove material while conveyor or spinner is running!
Lubrication
Make sure unit is clean and completely dry. With spreader empty, shut down spinners and run conveyor at 20 RPM. Lubricate conveyor chain via display through two full revolutions of conveyor. Lubricate every 10 hours of spreading, or at the end of each day’s use.

Tension
Proper chain tension is a factor in chain and sprocket life. Measuring from rear of unit, top of chain should appear between MIN and MAX lines in sight window (Figure 2A), and conveyor should touch bottom sill flange at 36” - 40” (762 - 1016mm) mark as shown in Figure 3.

If manual adjustments need to be made: With spreader unloaded, run conveyor at 15 - 20 RPM. On valve block, loosen conveyor tension valve jam nut. Turn counterclockwise to lower tension, or turn clockwise to increase tension (Figure 2B).

Insert Bin

WARNING
Keep hands, feet, hair and clothing away from moving parts while system is operating as there may be danger of entanglement!

Using a 3/4” wrench, turn idler extenders at rear of unit to adjust tension. Turn clockwise to increase tension, and turn counterclockwise to decrease tension. Measuring from rear of insert bin’s sill, conveyor chain should touch bottom sill flange at 30” - 34” (76 - 86cm) mark. Measurements must be equal between each side.

NOTICE!
Over-tensioning of conveyor chain will lead to excessive load on the system, causing excessive chain and sprocket wear and can cause extremely high starting pressures. Under-tensioning allows conveyor chain to “wrap” around drive sprockets and not exit sprocket freely, causing excessive chain stretch and surging of the conveyor which will result in interrupted flow of material to the spinners.
Lubrication & Maintenance

#4 BOC Conveyor Belt Maintenance

Standard belting for the #4 conveyor is moderately oil resistant (MOR) that is impervious to moisture, weathering, and normal action which can be used with chemical-impregnated fertilizer or oil-based additives.

- Inspect belt fastener occasionally for wear or “raveling” of belt grip area.
- Make sure belt connecting pin is positioned correctly as shown in Figure 3.

**NOTICE!**

Pin must not rotate. If pin ends are not bent down and tight against lacing, the ends may cut into the chain shield sealers or belt wipers.

Figure 3 - Conveyor Belt Connecting Pin Installation
**Spinner Fins**

Visually inspect spinner fins (Figure 4) daily for build-up of material and wear. Spinner discs and fins must be kept clean and polished. Even a small build-up of material on a spinner can significantly affect the spread pattern. Rough, bent or worn fins will produce bad spread patterns. Replace worn fins or discs as needed. See Fin Kit Installation Instructions for replacement part numbers and instructions.

**Spinner Deflectors**

Visually inspect spinner deflectors (Figure 5) daily for build-up of material and damage. Clean as needed. Even a small build-up of material on a spinner deflector can affect the spread pattern. If damaged, bent or otherwise, replace. See Parts List in this manual for replacement part numbers.

**Material & Hillside Flow Dividers**

Visually inspect material divider (Figure 6) and hillside flow dividers (as equipped) daily for build-up of material and wear. Any build-up of material on divider components can affect performance. Clean as needed. Replace worn or damaged parts as necessary. See Parts List in this manual for replacement part numbers.
Lubrication & Maintenance

Conveyor Gearcase

Drain oil in a new unit after first two weeks (or not more than 100 hours) of operation, and flush gear case thoroughly with light oil. Refer to “Lubricant and Hydraulic Oil Specifications” section for proper grade oil and recommended amounts of lubricant. After initial change, oil should be changed every 2,000 hours of operation or annually, whichever occurs first. Check gearcase oil level monthly.

Bin Sensor

<table>
<thead>
<tr>
<th>WARNING</th>
<th>Stay out of the spreader. Do not climb on spreader. Use a portable ladder to inspect, clean and maintain the bin sensor from outside the spreader. Failure to do so could result in injury from falling.</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOTICE!</td>
<td>Wipe sensor clean periodically to prevent accumulation of product. Avoid wet material as it may stick to sensor. If material sticks to sensor it won’t warn user when bin is low.</td>
</tr>
</tbody>
</table>

Clean sensor with long handled brush or hose from outside of spreader. Do not aim high pressure sprayer directly at sensor—it could damage the components.

Lubrication of Bearings

Grease in a bearing acts to prevent excessive wear of parts, protects ball races, and balls from corrosion and aids in preventing excessive heat within the bearing. It is very important the grease maintain its proper consistency during operation. It must not be fluid and it must not channel.

Make sure all fittings are thoroughly cleaned before grease is injected. Points to be lubricated by means of a grease gun have standard grease fittings.

Lubricate bearings by pumping grease slowly until it forms a slight bead around the seals. This bead indicates adequate lubrication and also provides additional protection against the entrance of dirt.

Fasteners

Tighten all screws fasteners to recommended torques after first week of operation and annually thereafter. If loose fasteners are found at anytime, tighten to recommended torque. Replace any lost or damaged fasteners or other parts immediately. Check body mounting hardware every week.

Clean-Up

<table>
<thead>
<tr>
<th>NOTICE!</th>
<th>High pressure wash can inject water and/or fertilizer into control components, causing damage. Use caution when cleaning these areas.</th>
</tr>
</thead>
</table>

Thoroughly wash unit every two to three days during the operating season to maintain minimal maintenance operation. Hose unit down under pressure to free all sticky and frozen material.

It is important the unit be thoroughly cleaned at the end of each operating season. All lubrication and maintenance instructions should be closely followed. Repaint worn spots to prevent formation of rust.

MULTIBIN Meter Wheel(s): Pull inspection plug on right hand side of micro assembly. Blow out with compressed air.
Lubricant & Oil Specifications

**Hydraulic System**

Use premium quality lubricants with 100-200 SUS or 20-43 cSt viscosity at operating temperatures. The hydraulic fluid's specifications in the table below are for normal operating conditions. Extreme environments or dirty conditions may require the use of different oils. Consult your New Leader dealer or the Product Support Department at Highway Equipment Company for systems operating outside normal conditions.

<table>
<thead>
<tr>
<th>Ideal Oil Operating Temperature</th>
<th>115-158°F (46.11-70°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recommended Premium Lubricant</td>
<td>Multi-Purpose Agriculture Hydraulic &amp; Transmission Oil</td>
</tr>
<tr>
<td>Lubricant Specifications</td>
<td></td>
</tr>
<tr>
<td>Viscosity Index</td>
<td>Greater than 130</td>
</tr>
<tr>
<td>Viscosity at 40°C, cst</td>
<td>Less than 68</td>
</tr>
<tr>
<td>Viscosity at 100°C, cst</td>
<td>Greater than 9</td>
</tr>
<tr>
<td>Acceptable Fluid Example</td>
<td>Mobil 424</td>
</tr>
</tbody>
</table>

**Gearcase Lubricant**

Fill the gearcase with non-corrosive type extreme pressure (E.P.) gear oil conforming to MIL-L2105 B multipurpose gear lubricating oil requirements (API Service GL 4) based on ambient temperatures listed below:

- Single Pinion: 1 Pint (.50 L)
- Dual Pinion: 1.5 Pints (.70 L)

<table>
<thead>
<tr>
<th>Ambient Temperature</th>
<th>Oil Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Below 40°F (4.4°C)</td>
<td>SAE 80 E.P.</td>
</tr>
<tr>
<td>40° - 100° F (4.4° - 38°C)</td>
<td>SAE 90 E.P.</td>
</tr>
<tr>
<td>Above 100° F (38°C)</td>
<td>SAE 140 E.P.</td>
</tr>
</tbody>
</table>

**Grease Gun Lubricant**

Use a waterproof ball and roller bearing lithium base lubricant with a minimum melting point of 300°F (150°C). This lubricant should have a viscosity which assures easy handling in the pressure gun at prevailing atmospheric temperatures. The grease should conform to NLGI No. 2 consistency.

**Conveyor Chain Oiler**

Use a 75% diesel fuel and 25% SAE 10 oil mixture on the links and rollers.
The spreader should be regularly lubricated with the lubricants recommended in this manual in accordance with the following chart:

<table>
<thead>
<tr>
<th>Location</th>

Pre-and Post-Season Checklist

IMPORTANT! Do not operate or work on machine without reading and understanding the operator’s manual.

Before starting engine/before starting machine operation

- Program rate controller and document settings
- All stop, tail, and turn lights function properly
- Tire pressures are equal on each side of chassis
- Battery condition and connection
- Electrical connections are tight and secure
- All fasteners are secure
- Inverted V is secure and installed properly
- Sensor(s) are functioning properly
- Lubricate all grease fittings
- Hydraulic oil level and line connections are tight
- Hydraulic filters are current and gauge is functional
- Chain oiler tank is full and operates correctly
- Hydraulic hoses are secured properly
- Gearcase oil level is correct
- All guards and shields in place
- Spinner assy moves through full range of operation
- Spinner discs and fins are installed properly
- Spinner discs and fins are in acceptable condition
- Material Divider assembly is square and secure
- Material Divider is clean of build-up
- Feedgate assembly is level and clean of build-up
- Encoder installed and secured
- Spinner sensor adjusted to proper gap

Start engine/Start and run to operational temperatures

- Hydraulic fittings are tight and no leaks *
- All pressure transducers are operating correctly
- Check operation of all alarms
- Check main relief valve setting: ______ PSI

Stop operation/Turn off engine and engage parking brake

- Visually check for leaks
- Check belt/chain tension and alignment
- All oil levels full

Perform Calibrations

- Product density testing, crush strength, and SGN scale (See Spread Pattern Calibration section for instructions).
- Catch tests of all products and at least 1 blend for conveyor calibration and document settings and product characteristics
- Spread pattern tests of all products and at least 1 blend and document settings and product characteristics

End of Season

- Empty unit of all material
- Sand and touch-up paint as necessary
- Wash chain conveyor, lube thoroughly when dry
- Check spinner discs and fins for wear
- Clean unit inside and out
- Check for leaks
- Lubricate all grease fittings
- Ensure all fasteners are secure
The following pages contain representative hydraulic schematics and flow diagrams for the NL4500G4 CNH Trident model spreader.

Controller Operations

Introduction

ISOBUS is a protocol standardizing communication between chassis, displays, farm management software, and implements. Adhering to ISO 11783 standards, ISOBUS allows chassis and implements of different colors to share information through a common display. The use of ISOBUS technology allows the end user to minimize the number of necessary monitors in the cab of the chassis, while still enabling full functionality of the implements. The data displays the same way on any monitor.

How the ISOBUS Works

The BUS is a distinct set of conductors designed to carry data and control signals within a system of parallel connected equipment. Information from the equipment modules is transmitted through the BUS to a Virtual Terminal (VT) in the cab. The Virtual Terminal (VT) uploads a User Interface (UI) which feeds into any Display Monitor. From one Display Monitor, the user can read information and make control changes to the implement(s). Since everything is virtual, multiple implements can be controlled with one monitor by switching back and forth between different VT’s.

Terminologies

• ISOBUS - An electronic communications network used on agricultural and forestry equipment that adheres to the ISO 11783 standards.
• VT (Virtual Terminal) - The electronic interface that resides within the system, rather than on the Display Monitor. By being virtual, the information will display consistently the same on any monitor being used.
• UI (User Interface) - The displayed information and controls the user interacts with on the Display Monitor to make any necessary changes to implement performance.
• ECU (Electronic Control Unit) - New Leader module that controls specific functions of the implement and is attached to the BUS.
• Task Controller - A crucial software component that resides within the Virtual Terminal and is required to provide support for Data Logging, Variable rate application via prescription maps, and on/off implement section control via AutoSwath.
• CANBUS - A CAN (Controller Area Network) BUS system is a vehicle bus standard that allows microcontrollers and devices to communicate with each other within a vehicle without a host computer.
• Display Monitor - The physical monitor used in the cab that communicates with the VT to run the implement(s) and display data from the operations.
Requirements

System Requirements:
- Virtual Terminal version 3 that supports AUX-N functionality
- Task Control (Multi-product up to 4 bins)
  - TC-BAS
  - TC-GEO
  - TC-SC

Function:
- VT will load New Leader UI and assign functions to in-cab switches.
  - Ability to track totals.
  - Ability to log as-applied maps and load prescription maps.
  - Ability to activate section control or AutoSwath.
**Controller Operations**

**Navigation**

To activate the New Leader Controller Interface, power up the monitor and activate the VT settings. For instructions on how to activate the VT, see the Manufacturer’s Operations Manual for the specific monitor being used.

Activation of VT will bring up the New Leader Home Screen, also called the “Run Screen”, as shown in Figure 1.

An on-screen Numeric Keypad is made available for changing configuration settings and calibration numbers. Press the keypad button to access the on-screen numeric entry screen. Keypads may look different depending on VT being used.

Navigation Control Buttons

- Back Button
- Forward Button
- Return to Previous Screen
- Accept Entry
- Cancel
**Controller Operations**

**Machine Configuration**

**NOTE:** Refer to default settings table at end of controller section for factory setup defaults.

**NOTE:** Before use, Display Monitor must be setup to enable VT connection and a machine configuration may need to be built. See Manufacturer's Operations Manual for detailed instructions on these processes.

### Initial Configuration/Factory Setup

(Only seen on first boot, or if system is reset/reconfigured)

- Power up Display Monitor and activate VT.

- Alert screen appears identifying that system is not configured. Press ✅ to continue.

Overview of attached modules:

- Number of spreader modules will be shown along with any add on modules. Press ➔ to continue.
Enable Installed Bins

- Enable all bins that are installed on the unit by pressing the button next to each. A \( \square \) will appear next to enabled bins as shown. Press \( \triangleright \) to continue.

Bin Settings

Bin settings include Name, Capacity, Bin Sensor, Feedgate enabled/disabled, and Pressure Transducer calibration.

- Enter Capacity for Main Bin using keypad. Enable or disable bin level sensor as required. Press \( \triangleright \) to edit pressure transducer settings. If standard transducers are being used, press \( \triangleright \) to continue.

- Enable transducers and set calibration settings as necessary (adjust only if standard HECO provided transducers are not being used). Press \( \triangleright \) to continue.

- Repeat step 3 for MultiApplier or MultiBin Bin 2 as necessary. Press \( \triangleright \) to continue.
• Repeat step 3 for MultiBin Micro 1 as necessary. Press \( \text{Continue} \) to continue.

• Repeat step 3 for MultiBin Micro 2 as necessary. Press \( \text{Continue} \) to continue.

• Monitor- open loop control with spinner speed read out.
• Basic Single- Closed loop control for one PWM valve- Used on L4000
• Basic Independent- Closed loop control for 2 PWM valves- Used on L4500
GPS Offsets

Editing the task controller GPS offset settings will determine drop point of material behind chassis.

- Select Towed or Self Propelled and enter GPS Offset using keypad.
- For single axle towed units, enter the distance from the center of the hitch pin to the center of the axle (a). Then enter the distance from the center of the axle to the center of the spinner disc (b).
- For self-propelled units, enter the distance from the center of the rear axle to the center of the spinner disc (a).
- NOTE: For units and trailers with tandem axles, use the center of the tandem for measurement reference point.
- Press \( \rightarrow \) to continue.

System Setup Summary

- Verify all settings are correct. Press \( \checkmark \) to continue or \( \rightarrow \) to go back and adjust as necessary.

Configuring Auxiliary Switches

- Switches must be configured before calibration.
- Switchbox switches need to be mapped. Use the Display Monitor’s operations manual to map all switches as necessary.
**Controller Operations**

**Settings**

Changing machine calibrations allows operator to enable/disable bins, adjust valve calibration numbers, change alarm settings and reset modules. On the Home Screen, press to change these settings:

Press **Profile Management** to enable/disable bins.

**Enable/Disable Bins**

- Each Installed Bin (as set up in Step 4) will appear. Press each "Enable" button to enable or disable each bin as appropriate for the current job.

**Valve Calibration Adjustment**

- Press **Control Valve Settings** to adjust valve calibration numbers.

**NOTE:** Default values are not fine tuned and may result in a slower response time than desired. Adjust at first time start up and when valve is replaced.
**Controller Operations**

- Press to set spinners. Enter appropriate settings:
  - PWM Valve settings:
    - “Monitor” - no PWM control
    - “Control” - tries to maintain spinner speed at all times regardless of available hydraulic flow. Best for hydrostatic or CVT drives.
    - “Hold” - Preserves last PWM signal to valve when conveyor is deactivated. Best for geared transmissions with gear pumps.

- PWM Frequency - Frequency that PWM control valve is pulsed at. Settings can be found from valve manufacturer.
- Zero Flow Offset - Represents maximum duty cycle sent to control valve without producing any hydraulic flow from. Increase this number to hit target rate sooner.

**IMPORTANT!** Setting Zero Flow Offset too high will cause spinners to overshoot Low Spinner Speeds and could cause delay in reaching set speed. Adjust as needed in small increments.

- PWM Gain - Determines how aggressively control valve responds when making rate adjustments. Higher value means more aggressive system response.

**IMPORTANT!** Setting PWM Gain too high spinners will become erratic. Adjust as needed in small increments.

- Set Conveyors by selecting each bin at bottom of screen.

**NOTE:** If using PWM valves instead of Servo valved, select “PWM” from “Control Valve Type” list and enter settings as per notes on Spinner valves and test for accuracy.

**NOTE:** Setting value too low can cause product control system to continually hunt for target application rate. Setting too high will cause excessive product application error and a delay in target rate being reached.
Controller Operations

Enter appropriate settings:
- **Valve Response 1** - Determines speed of servo valve when product control error exceeds Response Threshold setting. Represents fast speed of servo valve. Decreasing value will cause servo valve to run slower. Default setting is 40%.
- **Valve Response 2** - Determines speed of servo valve when product control error is less than Response Threshold setting. Represents slow speed of servo valve. Decreasing value causes servo valve to run slower. Default setting is 8%.
- **Response Threshold** - Determines where control channel switches between using Valve Response 1 and Valve Response 2 speed setting. Leaving all other valve control settings at default value and making small adjustments to this setting is usually all that is required to fine-tune system performance. Default setting is 4.

**NOTE:** Decreasing Response Threshold value will have overall effect of speeding up servo valve response. Increasing Response Threshold value will have overall effect of slowing servo valve response.

- **Allowable Error** - Determines the percent of error that is allowed prior to product control system making any flow rate changes. 2% - 3% is normal dead band setting range.

**Alarm Settings**
- **Press** to adjust alarm settings.
- **Edit each Alarm setting as desired.**
Reconfigure System

NOTICE! Pressing “Reset” under “System Settings will restore all settings to factory default and all calibration numbers will be lost. It should only be pressed if instructed to do so by service technician or New Leader product support.

• Press System Settings to reset/reconfigure system.

• “Reconfigure” allows the user to adjust any of the system settings made during first time start up (“Machine Configuration” steps). “Reset” will restore all settings to factory default and all calibration numbers will be lost.

• Display will then jump to GPS offset screen. See “GPS Offsets” in this section for details.
Controller Operations

Switch Assignment

- Press [Show Connected Devices] to show connected devices.
- Connected devices will appear in the device list.
- If using a New Leader switch box, press [Set Default Assignment] to automatically map the switches to the correct function.
Component Calibration

NOTE: Before regular use, system must be calibrated to ensure accurate spreading.

- Power up Display Monitor and activate VT.
- The Run screen will appear. Press \( \text{ } \) to continue.

Spinner Disc Calibration

- Press \( \text{ } \) to calibrate spinner discs.

- Use keypad to edit numeric setting as necessary:
  - Standard spinner discs, set to 4.
  - If using 5 fin discs, set to 5.
  - If using 6 fin discs, set to 6.
  - Press \( \text{ } \) to accept change and continue,
  - or \( \text{ } \) to cancel.
Controller Operations

Calibrate Rate Encoder

1. Press Rate Encoder to calibrate encoder.

2. Use keypad to edit setting as necessary. Enter 180 or 360 as labeled on back of encoder. Press to continue.
Controller Operations

Conveyor Calibration

**IMPORTANT!**

For best results, a catch test must be done for each product to be spread before season begins, or any time a new supply of product is received.

- Press **Conveyor** to calibrate conveyor.
- Manually enter cubic feet per revolution (CFR) rate using keypad.
- To begin catch test, press **Static Routine** for the bin to be tested.
- To perform in-field calibration, press **Field Routine** for the bin to be tested.

**WARNING**

Do not work near rotating spinners. Severe injury can result from contact with moving parts.

- Spinners will automatically shut off. For added safety, disconnect PWM valves. Press ✔️ to continue.

- Verify Feed Gate Height and Product Density are correct. Use keypad to edit as needed. Enter Dispense Amount using keypad. Press ➤ to continue.
- Bring engine up to full operating RPM.
**Controller Operations**

- Using the control buttons \(\text{Reset}, \text{Run}, \text{Stop}\), run a catch test. If spreading product that has already been tested, press \(\text{Continue}\) to continue. To begin a test, press \(\text{Start}\). Conveyor will run.

- Once controller dispenses specific amount, conveyor will stop. Press \(\text{Continue}\) to continue.

- Weigh material dispensed and enter actual weight of material dispensed. Press \(\text{Continue}\) to continue.

- It is recommended a minimum of three (3) tests be done PER PRODUCT to ensure accuracy. Once each test is done, press “Repeat Calibration” to run a subsequent test. When finished, press \(\text{Finish}\).

- The main Calibration screen will appear. To calibrate with a known amount brought to a field, press \(\text{Field Routine}\).

**Note:** Field totals can be reset from Summary Screen if needed.
• After dispensing product in field, screen displays system perceived total of dispensed product. To enter actual dispensed amount, press ▶.

• Using keypad, enter actual weight of product dispensed. Press ▶ to continue.

• New cubic feet per revolution (CFR) rate will be displayed. Press ✔ when finished.
Controller Operations

Operations/Features

Create New Job

The following is a guide for running system for first time.

1. Create Job in display.

   This operation will vary from display to display. Refer to display manual on how to create a job using Task Control. When finished, activate VT.

   Material Density will vary from product to product. It is imperative that correct density is entered in controller for rates to come out correctly.

   • To change product density, press

   • Use keypad to enter density. Press ✓ to accept change and continue, or ✗ to cancel.
3. Verify task control in Target Rate 1.
   - Rate will be driven by job setup in display. To verify this, TC should show in place of target rate 1. If not, verify job has been created correctly. Refer to display manual.

4. Verify total spread width and spinner speed:
   - Different products may require different spread widths or spinner speeds. Always verify the material profile is configured correctly before applying product.
   - Edit current profile or create a new one if necessary. See “Material Profile Management” for details.

   - Enable Spinner Circuit. Using keypads, enter Spinner Speed and Total Spread Width. If desired, enter Spinner Offset (see Boundary Spreading section of this manual for instructions).

5. Verify gate opening:
   - Press to set bin levels and change gate opening.
• Use keypad to set feedgate opening to correct reading.

6. Verify CFR number is correct:

Different products may require different calibration numbers. Verify the CFR number is correct before applying product.

• Press \( \text{Conveyor} \) then...

• Use keypad to change CFR number as needed.
Feedgate Optimizer

NOTE: This program will help to determine the ideal gate position for each specific application, based on speed, swath width, density, and application rate.

1. Power up Display Monitor and activate VT.
   - The Run screen will appear. Select appropriate bin button at bottom of screen. Press to continue.

2. Enter average speed and target rate:
   - The Bin Events screen will appear. Press to continue.

3. Accept recommended settings:
   - Recommended feedgate opening will be displayed along with minimum and maximum rates. If is selected, new feedgate setting will save and automatically move to proper height. If is selected, new settings are ignored and system settings are kept.
Boundary Spreading

NOTE: This program allows the operator to independently modify spinner speeds to change the width of spread to either side, creating a “boundary” line to maximize spreading efficiency.

• On the Run Screen, press to access spinner settings.

1. Enter spinner offset:
• The Spinner Settings screen will appear. To create a Boundary, use the keypad to enter a specific Spinner Offset. Spread pattern tests should be completed for each product to be spread to determine best offset settings, based on density, crush strength and size. See “Spread Pattern” section for details. Press to save and return.

2. Enable boundary spreading:
• When running normally, Run Screen will display all swath sections normally. To activate the Boundary, flip the spinner switch on the switch box to the side that the boundary is on.
• EXAMPLE: If spreading with a boundary to the right hand side in relation to direction of travel, flip the switch to the right to limit the spread pattern on the right hand side.

• When Boundary is activated, Run Screen will display with the outer swath section darkened on the boundary side (right hand boundary activation shown).
• To view unlocked features, press **Unlocks**.

• Current unlocked features will display. Press “Unlock” to display module serial number and registration number. Press **Back** to return.
Controller Operations

Hydraulics

NOTE: This program will show a visual representation of hydraulic monitoring, including system pressure, temperature, conveyor pressure, and indicators for low fluid level and filter restriction. Individual bins can be viewed by pressing the bin icons along the bottom of the screen.

1. Power up Display Monitor and activate VT.
   • The Run screen will appear. Press to continue.

   • The Tools main screen will appear. Press to continue.

2. View hydraulic monitoring:
   • Hydraulics - System pressure, Temperature, and status of Fluid Level and Filter Restrictions will show system wide.
   • Conveyor Pressure will display for Bin 1, and cumulatively for Bins 2 - 4 as equipped.
   • Fluid Level and Filter Restriction status are shown in the lower right hand corner. When within acceptable levels, the boxes are outlined in green and display a (as shown). If fluid level is low or if filter is restricted, the box will be outlined in red and display a
   • Press to return to Tools Screen.

NOTE: If the spreader does not have an onboard hydraulic reservoir, fluid temperature, fluid level and filter restriction are not accurately displayed.
Controller Operations

Bin Flush

NOTE: This program is used to quickly empty each bin. Spinners will automatically shut off and allow the operator to select which bins to empty.

1. Power up Display Monitor and activate VT.
   • The Run screen will appear. Press □ to continue.

   • The Tools main screen will appear. Press □ to continue.

   WARNING Do not work near rotating spinners. Severe injury can result from contact with moving parts.

   WARNING For added safety, unplug PWM valves to ensure spinners cannot run while in Bin Flush mode to avoid injury.

   • Bin Flush will automatically disable spinners. Press □ to continue.
2. Select bins:
   - Select bins to be flushed by pressing enable buttons next to each. To adjust conveyor RPM for flush, press 

3. Set conveyor RPM:
   - Use keypads to set conveyor RPM for each bin. 20 RPM is default.
   - Bin 1 Maximum = 50 RPM
   - Bin 2 Maximum = 60 RPM
   - Bins 3 & 4 Maximum = 85 RPM

Press ✅ to continue.

4. Perform bin flush:
   - To flush bins, press ⏯. Conveyors will run until ⏹ is pressed.

When process completes, press ⏹ to continue.

WARNING  Do not work near rotating spinners. Severe injury can result from contact with moving parts.

- When exiting Bin Flush process, spinners will restart. Plug PWM valves back in if it was previously disabled. Press ✅ to continue.
Controller Operations

Body Module

1. Power up Display Monitor and activate VT.
   - The Run screen will appear. Press \[\text{Run} \] to continue.

   - The Tools main screen will appear. Press \[\text{Bin Cover} \] to continue.

Bin Cover Control

- If equipped, press \[\text{Bin A} \] (A) to open and close tarp.
- If MultiBin insert is installed, press \[\text{Bin B} \] (B) to open and close Micro cover.
Controller Operations

**Chain Oiler**

**NOTE:** This program is used to manually oil the chain, set alarm frequency, and set auto-lube settings.

1. Power up Display Monitor and activate VT.

   - The Run screen will appear. Press \[\text{Run Button}\] to continue.

2. Set duration:
   - Use keypads to set oil chain duration (recommended 1 revolution). Lube routine is not used at this time.
3. Set conveyor dimensions:
   - Press “Dimensions” to input conveyor dimensions. Use keypads to input conveyor length and sprocket diameter.
     
     Press ✔ to return to Chain Oiler screen.

     Press ✔ to return to Tools Screen.

4. Set service reminder:
   - Press “Service Reminder” to set chain oiler reminder. Enable Reminder and use keypad to enter interval hours desired. To restart reminder after manually oiling conveyor, press ✔

     Press ✔ to return to Chain Oiler Screen.
Bin Sequencing

NOTE: This function allows the operator to run same product out of two bins, chaining them together so bin 2 starts emptying immediately after bin 1 is empty.

1. Power up Display Monitor and activate VT.

   • The Run screen will appear. Press to continue.

   • The Tools main screen will appear. Press to continue.

   • Press the Bin Chaining tab at the bottom of the screen to continue.
2. Setup Bin Sequencing (Chaining):
   
   A. Enable bin chaining for Bins 1 & 2, or Bins 3 & 4 as applicable.
   
   B. Select trigger type (Manual Only, Low Bin Threshold, Low Bin Sensor, Container Reaches 0).
   
   C. Select which bin to empty first by pressing arrow button until arrow points to second bin to empty. Figure at right shows Insert Bin emptying first and Main Bin second; Micro Bin 2 emptying first and Micro Bin 1 second.

   Press **✓** to continue.

3. To manually switch bins:
   
   • When Bin Sequencing is enabled, Manual Override button appears on Run Screen to force switch over to next bin.

A Catch Test is required prior to each season, before using a new product, or if a significant visible change has occurred with a product.

**Catch Test**

The CFR number, or cubic feet per revolution number, is a calibration number entered into the controller to determine rate output from the spreader's conveyor. A catch test is performed to verify accurate rate output per the controller.

NOTE: An optional calibration chute (P/N 312688) is available to simplify the catch test process. The calibration chute fits all New Leader spreader models with 30” wide conveyor bottoms. Contact your local New Leader dealer for details.

**WARNING**  
To prevent injury, disable the spinners by unplugging the PWM valve before beginning the catch test procedure.

1. Disable the spinners by unplugging the PWM valve(s).
2. Move the spinner assembly to the 4” (102 mm) position.
3. Remove the Material Divider back plate, and Vane Assembly (if applicable). Install calibration chute if available.
4. Position an end loader or other suitable device beneath the spinners to catch material.
5. Load material into all applicable bins.
6. Prime the conveyor as specified per the controller.
   - If using a calibration chute, run the conveyor just until material reaches the end. Remove any excess material that falls into the catching device.
   - If not using a calibration chute, run the conveyor until the spinner discs are full of material. Remove any excess product from the catching device. Do not remove material from spinner discs.
7. Measure the depth of material on the end of the conveyor to verify the constant number feedgate height information entered into the controller. Adjust feedgate height or recalibrate feedgate as necessary.
8. Verify that all other product settings entered into the controller are correct.
9. Select the correct bin in the controller for the first bin to be tested. Enter the anticipated weight of product to be dispensed from the conveyor.
10. Start the engine and engage hydraulics. Allow to run for several minutes to bring hydraulic oil up to operating temperature. Bring engine up to operating RPM.
11. Following the setup wizard on the controller, run the catch test. The conveyor will start dispensing material, and automatically shut off when the estimated amount of product is dispensed.
12. If not using a calibration chute, leave the material on the spinner discs. Weigh the amount of product that the conveyor actually dispensed into the catching device, and note the result.
13. Enter the actual weight of material dispensed into the controller. The controller will then automatically perform the calibration.
14. Repeat Steps 5 - 12 for all other applicable bins, if an insert bin is installed.
15. Once satisfactory results have been achieved for all applicable bins, turn the engine off, replace the back plate on the Material Divider, return the spinner assembly to its original position setting, and plug the PWM valve(s) back in.

NOTE: For more information on controller operations and setup, contact your local dealer.
Spread Pattern

Product quality will affect spread pattern and product performance. Spread pattern testing is required to ensure proper application of material. Larger products will produce wider swath widths.

Spread pattern is adjusted using one or more of the following:

- Point of material delivery on spinner discs
- Spinner speed
- Angle of the distributor fins on the spinner discs

Since adjustments will vary for each job, trial and experience must be used to determine the adjustments required to obtain the swath width and spread pattern desired.

Spread Pattern Test Kit

Spread Pattern Test Kit, part no. 313960, includes the following:

NOTE: If desired, a material calibration kit is available to aid in measuring product quality. Contact your local dealer for details.
Spinners

NOTICE! Spinner discs and fins must be kept clean and polished. Even a small build-up on a spinner fin can significantly affect the spread pattern. Rusty, rough, bent or worn fins will produce poor spread patterns.

In general, critical spinner speed will fall somewhere between 600 and 900 RPM. Spinner speed is adjusted by changing the settings in the controller. Proper spinner speed adjustment is critical in obtaining optimal spread patterns. The best spinner speed to use will depend entirely on the material being spread, and must be determined by testing.

Spreader Preparation

The spreader to be tested must be in good mechanical condition and properly adjusted. Refer to operator’s manual for details.

All damaged and worn parts must be replaced. Spinner discs and fins must be free of any material build-up, rust or paint.

Fill the hopper with the material to be spread. Run the material out to the end of the conveyor.

Set the feedgate and the in-cab controller to deliver the required rate per acre. Make sure the feedgate is level and the indicator reflects the actual gate opening measured by standing a tape measure vertically in the material.

NOTE: Do not match slope of endgate when making this measurement. Measurement must be perpendicular to conveyor.

Adjust the spinner assembly by turning the crank or, if an actuator is installed, change the setting in the controller. To begin testing, position the spinner according to following chart.
NOTE: This chart is to be used as a reference only to begin testing.

* 15 mph when using high performance (HP) hydraulics.
Test Procedure

Using the data sheets supplied with the kit, document all spreader information and adjustments as necessary. See Figure 1.

Select an area for testing measuring at least 120 feet x 200 feet (37 m x 61 m), and with a slope of less than two degrees.

All testing should be done when the wind velocity is less than 5 MPH (8.05 km). If wind is present, testing must be done with spreader traveling parallel (within ± 15 degrees) to the wind direction.

Do not allow loaded spreader to sit for more than one hour prior to testing.

At this stage of testing, drive the spreader over the collection trays in ONLY ONE DIRECTION.

Insert a plastic grid into each of the 23 collection trays. Position the blue collection tray in the center of the spreader’s path with the longest dimension of the tray parallel to the direction of travel. Position the first left-hand and right-hand trays 10’ (3m) from center, and all subsequent trays on 5’ (1.5m) centers.
**Spread Pattern**

**Four-Wheeled Vehicles**

For four-wheeled application vehicles, position the spreader at the beginning of the course so that the vehicle will straddle the center collection tray. See Figure 2.

Engage spinners before navigating the course. As the vehicle approaches the flag positioned 75’ before the row of collection trays, engage the conveyor(s). Do not shut the conveyor(s) off until the vehicle approaches the second flag.

Drive spreader completely through course at normal operating speeds.

![Figure 2 – Four-Wheeled Vehicles](image)

**Three-Wheeled Vehicles**

For three-wheeled application vehicles, straddling the center tray is not possible. Place the center collection tray beneath the vehicle just behind the front tire when the spreader is in position at the beginning of the course. See Figure 3.

Engage both the spinners and conveyor(s) before navigating the course. Do not shut the conveyor(s) off until the vehicle approaches the second flag.

Drive spreader completely through course at normal operating speeds.

![Figure 3 – Three-Wheeled Vehicles](image)
Test Results

After navigating the course, shut the spreader down and park in a secure location.

Using the funnel, transfer the contents of each collection tray into its corresponding test tube beginning at one end of the trays and working towards the opposite end.

If spreading a blend of materials, inspect all tubes to determine if the blend is consistent across the entire swath width. If the blend is not consistent, use a narrower swath width. The swath width should be based on the material thrown the shortest distance.

Record each test tube’s volume in the box on the data sheet under the corresponding tray position and graph the spread pattern profile. See Figure 4.

Looking at the material in the test tubes and the graphed profile on the data sheet, compare the overall shape of the spread pattern to the three acceptable patterns, shown in Figure 5. If an acceptable pattern has not been achieved, proceed to “Troubleshooting”. Once an acceptable pattern has been achieved, proceed to “Determining Driving Centers”.

Figure 4

Figure 5 – Acceptable Patterns
## Troubleshooting

NOTE: It is highly recommended that ONLY ONE ADJUSTMENT be made between test samples taken. If more than one adjustment is made, it will be difficult to determine which adjustment was responsible for the change in pattern shape.

<table>

</table>
| Light Outside Vehicle’s Tire Tracks  | ![Pattern](image3) | 1. Check spinner fins for material buildup, rust or paint.  
|                                      |          | 2. Increase spinner RPM.                                    
|                                      |          | 3. Move spinner fins to 2 - 3 - 2 - 3 positions. See Figure below. |
| Pattern Off Center                   | ![Pattern](image4) | 1. Check to see feedgate is level and free of caked material. 
|                                      |          | 2. Make sure hillside divider spinner assembly and material divider are mounted squarely and centered. 
|                                      |          | 3. Testing should be done parallel to wind.                  |

Figure 6

Spinner fins are adjustable to radial angle as shown in Figure 7. Refer to Figure 6 for fin adjustment recommendations.

Figure 7 - Spinner Fin Adjustment
Determining Driving Centers

Once an acceptable pattern is obtained, as shown in Figure 5, driving centers can be determined. To determine optimum driving centers (effective swath width), determine the average amount of material in the center of the pattern. Figure 8 shows an example data sheet recorded from the profile shown in Figure 9. Based on the example, the average amount of material in the center of the pattern is 3.0, as indicated with the red dotted line.

Next, locate the points on both the left and right side of the pattern where the amount of material is half the average amount at the center of the pattern. In the example shown in Figure 8, these points are located 45’ to the left of center, and 45’ to the right of center. The distance between these two points (90’) represents the driving centers to use.

NOTE: Once the effective swath width has been established, a change in the controller may be required.
Verifying Driving Centers

Once optimum driving centers (effective swath width) have been established, conduct a final “S” pass over the trays to verify. Refer to Figure 10.

1. With both the spinners and conveyor turned off, drive the spreader through the center of the course, establishing an “AB” line. If the spreader vehicle is a three-wheel type, remove the center pan.
2. Line the vehicle up with either end of the row of collection trays, at a distance from the “AB” line equal to the effective swath width.
3. With both the spinner and conveyor engaged, drive past the trays.
4. Switch back and drive over the center of the trays, down the “AB” line.
5. Drive through the row of trays and switch back once again, driving past the trays on the opposite side, at an equal distance from the “AB” line as the first pass.

If the driving centers were determined correctly, all trays should have a similar amount of material, showing a near flat profile in the test tubes. If the trays near the center of the row contain more material than the others, increase driving centers. If the trays near the center of the row contain less material, decrease driving centers.

**NOTE:** If spreading a blend of materials, verify blend of all products is consistent across all tubes.
