Interactive Features

NOTE: This manual incorporates several interactive features to provide supplemental information and ease of navigation. The information below is to aid in the identification and use of these features.

Hyperlinks

Hyperlinks provide direct access to a specific destination when clicked. The entire Table of Contents of this manual is hyperlinked to provide quick access to all sections of this manual when viewing the electronic version.

Hyperlinks within the content are denoted by blue, bold underlined text. Electronic format viewers can click these links for direct access to New Leader online features. Internet access is required.

Quick Reference (QR) Codes

Quick reference codes provide direct access to a specific destination when activated. An example is provided below. In the printed version of this manual, viewers may scan the codes with a supporting mobile device for direct access to New Leader online features. Mobile data is required.

The electronic version of this manual provides the option to scan codes on-screen, or to click the code like a button. Internet access/mobile data is required.
Insert Current New Leader Warranty
PLEASE ! ALWAYS THINK SAFETY FIRST !!

The purpose of this manual is to familiarize the person (or persons) using this unit with the information necessary to properly install, operate, and maintain this system. The safety instructions indicated by the safety alert symbol in the following pages supersede the general safety rules. These instructions cannot replace the following: the fundamental knowledge that must be possessed by the installer or operator, the knowledge of a qualified person, or the clear thinking necessary to install and operate this equipment. Since the life of any machine depends largely upon the care it is given, we require that this manual be read thoroughly and referred to frequently. If for any reason you do not understand the instructions, please call your authorized dealer or our Product Sales and Support Department at 1-888-363-8006.

It has been our experience that by following these installation instructions, and by observing the operation of the spreader, you will have sufficient understanding of the machine enabling you to troubleshoot and correct all normal problems that you may encounter. Again, we urge you to call your authorized dealer or our Product Sales and Support Department if you find the unit is not operating properly, or if you are having trouble with repairs, installation, or removal of this unit.

We urge you to protect your investment by using genuine HECO parts and our authorized dealers for all work other than routine care and adjustments.

New Leader Manufacturing reserves the right to make alterations or modifications to this equipment at any time. The manufacturer shall not be obligated to make such changes to machines already in the field.

This Safety Section should be read thoroughly and referred to frequently.

ACCIDENTS HURT !!!

ACCIDENTS COST !!!

ACCIDENTS CAN BE AVOIDED !!!
Important Safety Information

Figure 1.1 - The need for safety cannot be stressed strongly enough in this manual. At New Leader Manufacturing, we urge you to make safety your top priority when operating any equipment. We firmly advise that anyone allowed to operate this machine carefully read, learn and understand all messages and information in this manual and on machine’s safety decals before operating machine, as well as familiarize themselves with the location and function of all machine controls.

The following guidelines are intended to cover general usage and to assist you in avoiding accidents. There will be times when you will run into situations that are not covered in this section. At those times the best standard to use is common sense. If, at any time, you have a question concerning these guidelines, please call your authorized dealer or our Product Sales & Support Department at (800) 363-1771.

Safety Alert Symbols

TAKE NOTE! THIS SAFETY ALERT SYMBOL FOUND THROUGHOUT THIS MANUAL IS USED TO CALL YOUR ATTENTION TO INSTRUCTIONS INVOLVING YOUR PERSONAL SAFETY AND THAT OF OTHERS. FAILURE TO FOLLOW THESE INSTRUCTIONS CAN RESULT IN INJURY OR DEATH.

In this manual and on the safety signs placed on the unit, the words “DANGER,” “WARNING,” “CAUTION,” and “NOTICE” are used to indicate the following:

- **DANGER**: Indicates an imminently hazardous situation that, if not avoided, WILL result in death or serious injury. This signal word is to be limited to the most extreme situations and typically for machine components that, for functional purposes, cannot be guarded.

- **WARNING**: Indicates a potentially hazardous situation that, if not avoided, COULD result in death or serious injury, and includes hazards that are exposed when guards are removed. It may also be used to alert against unsafe practices.

- **CAUTION**: Indicates a potentially hazardous situation that, if not avoided, MAY result in minor or moderate injury. It may also be used to alert against unsafe practices.

- **NOTICE!**: Is used for informational purposes in areas which may involve damage or deterioration to equipment but generally would not involve the potential for personal injury.

**NOTE:** Provides additional information to simplify a procedure or clarify a process.
PREPARE FOR EMERGENCIES

Figure 1.2 - Be prepared if a fire starts. Keep a fully charged fire extinguisher and first aid kit in accessible place on the vehicle at all times.

Fire extinguisher must be Type ABC or Type BC.

Keep emergency numbers for doctors, ambulance service, hospital and fire department available at all times.

INSPECT HARDWARE BEFORE USE

Figure 1.3 - Inspect all bolts, screws, fasteners, keys, chain drives, body mounts and other attachments periodically. Immediately replace any missing or damaged parts immediately with proper specification parts.

Inspect spinner fins, spinner frame mounting and spinner fin hardware daily. Look for missing or loose fasteners, wear and cracks. Replace immediately if needed. Use only new SAE grade 5 or grade 8 screws and self-locking nuts.

Tighten all bolts, nuts and screws to specified torques. Refer to “Standard Torques” in Maintenance section of this manual.

HANDLE FLAMMABLE MATERIALS SAFELY

Figure 1.4 - Handle fuel and hydraulic oil with care. They are highly flammable.

Always stop the engine before refueling machine or filling hydraulic reservoir.

Never smoke while adding fuel or oil to machine. Add fluids in a safe place away from open flame and sparks.

Do not allow overflow. Clean up spilled fuel and oil immediately.

Always have a multipurpose dry chemical fire extinguisher filled and available during machine operation and when adding fuel. Know how to use it.
HANDLE HAZARDOUS MATERIALS SAFELY

Figure 1.5 - Materials to spread can be dangerous.

Improper selection, application, use or handling may be a hazard to persons, animals, plants, crops or other property.

A Safety Data Sheet (SDS) provides specific details on chemical products: physical and health hazards, safety procedures and emergency response techniques.

Check the SDS before starting any job using a hazardous material. Follow all instructions and precautions given by the material manufacturer.

WORK IN WELL-VENTILATED AREAS

Never run machine engine inside a building unless adequate ventilation is provided to safely and properly remove exhaust fumes.

Figure 1.6 - Always work in a properly ventilated area.

Engine exhaust fumes can cause sickness or death. If it is necessary to run an engine in an enclosed area, use proper equipment to safely remove exhaust fumes from the working area.

Open building doors and get fresh air into the working area whenever possible.

PROTECT AGAINST NOISE

Figure 1.7 - Long periods of exposure to high decibels or loud noise can cause hearing impairment or loss.

Wear proper hearing protection during periods of exposure to high decibels or loud noise.

Wear a proper hearing protective device such as earmuffs or earplugs to protect against high decibels and / or uncomfortable loud noises.
AVOID MOVING PART HAZARDS

Figure 1.8 - Entanglement in rotating drive lines or moving parts will cause serious injury or death.

Stay clear of all moving parts, such as shafts, couplings and universal joints.

Make sure all personnel are clear of machine before starting.

Figure 1.9 - Do not operate machine without all guards and shields closed and secured. Disconnect and lock out power source before removing guards.

Disconnect and lock out power source before adjusting or servicing.

Keep hands, feet, hair and clothing away from moving parts.

Figure 1.10 - Keep away from spinners while they are turning.

Rocks, scrap metal and other material can be thrown from the spinners violently. Stay away from discharge area.

Stop machine before servicing or adjusting. Wear eye protection.

Make sure discharge area is clear before spreading.

Figure 1.11 - Stay out of the spreader.

If it is necessary to enter the spreader, return to the shop, empty body, turn off all power, engage brakes, shut down engine and remove keys before entering.

Tag all controls to prohibit operation. Tags should only be placed, and later removed, by the person working in the body.
General Safety Rules

Operations

DO NOT CLIMB OR STAND ON MACHINE

Figure 1.12 - Never allow any personnel to ride in or on the machine.

Use only inspection ladder or portable ladder to view the unit. Use caution when getting on and off the ladder, especially in wet, icy, snowy or muddy conditions. Clean mud, snow and ice from steps and footwear.

Always maintain three-point contact with steps, ladders and handholds. Face the machine when mounting and dismounting inspection ladder. Do not jump off the machine.

OPERATE MACHINE SAFELY

Always walk around and visually inspect the machine before using. Check immediate vicinity of machine for people and obstructions. Ensure adequate visibility.

Avoid distractions such as reading, eating or operating personal electronics that take your attention away from operating the machine. Never operate the machine under the influence of alcohol, drugs or while otherwise impaired.

Always come to a complete stop before reversing. Be sure that all personnel are clear of machine path. Turn around and look directly for best visibility. Ensure all rear view mirrors are properly installed and adjusted. Use a signal person when backing if view is obstructed or when in close quarters.

Always disengage hydraulics before shutting down engine. DO NOT start engine with hydraulics engaged.
General Safety Rules

Transportation & Handling

TRAVELING & TRANSPORTING ON PUBLIC ROADS

Always walk around and visually inspect the machine before traveling on public roads. Check for damage and/or faulty components that can fail and create a hazard or unsafe condition. Make sure all machine systems operate properly, including but not limited to: headlights, tail and brake lights, hazard warning lights, turn indicators, parking brake, horn and rear view mirrors. Repair or replace any component that is not in proper working order.

Never drive machine at a speed that causes it to bounce or cause loss of control.

Obey all traffic safety laws and regulations. Operate the machine with hazard warning lights on, unless prohibited by law. It is the operator’s responsibility to activate and use road lights properly while traveling on public roads.

Cover all loads that may spill or blow away. Environmental damage may result. Do not spread dusty materials where dust may create pollution, visibility issues or interfere with traffic on public roads.

When transporting equipment or machine on a trailer, ensure it is properly secured. Be sure that SMV signs on equipment or machine are covered while in transport on a trailer.

Be aware of overhead structures and power lines. Make sure machine can safely pass under. Refer to “Dimensions & Capacities” pages in the Operations section of this manual.

NAVIGATING ROUGH & UNEVEN TERRAIN

Figure 2.1 - Turn slowly and be careful when traveling on rough surfaces and side slopes. Avoid holes, ditches and obstructions that may cause machine to roll over, especially with a loaded spreader.

Never drive near the edge of a gully or steep embankment.

Load may shift, causing vehicle to tip.
READ AND UNDERSTAND MAINTENANCE PROCEDURES

Figure 3.1 - Read the maintenance and safety instructions and understand them before performing any maintenance procedure.

Never perform any maintenance procedure or repair if the instructions and safety procedures are not fully understood. Only trained and qualified personnel should perform any maintenance procedure or repair.

Never modify any equipment or add attachments not approved by New Leader Manufacturing.

DO NOT SERVICE OR ADJUST MACHINE WHILE IN MOTION

Figure 3.2 - Never lubricate, service or adjust the machine or any of its components while they are moving.

Never wear loose clothing or jewelry when working near machine tools or moving parts.

Remove rings and other jewelry to prevent electrical shorts and other personal injury when in contact with machine tools or moving parts.

Close and secure all guards removed for service. Check all screws, bolts, nuts and fasteners for proper torques before operating machine.

WEAR PROPER PROTECTIVE EQUIPMENT

Figure 3.3 - Wear close-fitting clothing and proper safety equipment for the job.

Always wear eye protection when working on or around the machine.

Wear a suitable hearing protection device such as earmuffs or earplugs to protect against high decibels or loud noises.

Prolonged exposure to high decibels or loud noise can cause hearing impairment or loss of hearing.

Wear protective gloves to protect hands from cuts, abrasions and minor burns.
HANDLE FLAMMABLE SOLVENTS SAFELY

Figure 3.4 - Never use diesel fuel, kerosene, gasoline or any flammable solvents for cleaning.

Perform work using flammable fluids and solvents in a safe place away from open flame and sparks. Do not smoke.

Do not weld, grind or flame cut on any tank containing oil, fuel, fumes or any other flammable material, or any container that contents or previous contents are unknown. Move all flammable materials and containers away from work area.

Clean up spilled fuel and oil immediately.

Always have a multipurpose dry chemical fire extinguisher filled and available. Know how to use it.

USE PROPER LIFTING EQUIPMENT

Figure 3.5 - Use only lifting devices that meet or exceed OSHA standard 1910.184 or ASME B30.20-2013.

Never lift equipment over people.

Never lift a loaded unit. Never lift unit with any loose objects or persons in the body. Loads may shift or fall if improperly supported, causing death, serious injury or machine damage.

Before unfastening heavy parts or assemblies, support with adequate hoist or other device to prevent falling, tipping, swinging or any other movement that may cause injury or damage.

USE PROPER TOOLS FOR THE JOB

Figure 3.6 - Use of improper tools (such as a screwdriver instead of a pry bar, pliers instead of a wrench, a wrench instead of a hammer) can cause serious injuries or machine damage.

Use power tools only to loosen threaded parts and fasteners. Using power tools to tighten may cause over-tightening and component damage.

Use only service parts meeting New Leader specifications.
HIGH PRESSURE FLUID HAZARDS

Figure 3.7 - Escaping fluid under pressure can penetrate the skin causing serious injury.

Always stop machine, allow to cool and relieve pressure before servicing hydraulic system. Never open hydraulic lines under pressure. Make sure all connections are tight and all hoses are in good condition before pressurizing system.

Always use a piece of cardboard or wood to search for leaks instead of hand. Wear impervious gloves and eye protection when servicing system.

Seek medical attention immediately if fluid penetrates your skin. Gangrene may result if wound is left untreated.

AVOID HEATING NEAR HIGH PRESSURE FLUID LINES

Figure 3.8 - Flammable spray can be generated by heating near pressurized fluid lines, resulting in burns to yourself and bystanders.

Do not heat by welding, soldering or using a torch near pressurized fluid lines or other flammable materials.

Pressure lines can suddenly burst when heat goes beyond the immediate flame area.

AVOID TOXIC FUMES & DUST

Figure 3.9 - Hazardous fumes can be generated when paint is heated from welding, soldering or using a torch.

Remove paint before heating:
• Remove a minimum of 4 in (100mm) from area to be affected by heating. If paint cannot be removed, wear an approved respirator while heating or welding.
• Avoid breathing dust from sanding or grinding on paint.
• If a solvent or paint stripper is used, wash stripper away with soap and water before heating or welding. Remove solvent or paint stripper containers and other flammable material from area. Allow fumes to disperse for at least 15 minutes before heating or welding.

Do not use chlorinated solvents in areas where welding will take place.

Perform all work in a well-ventilated area that will carry all toxic fumes and dust away.
**General Safety Rules**

**Maintenance**

### CLEAN MACHINE OF HAZARDOUS CHEMICALS

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>During application of hazardous chemicals, residue can build up on the inside or outside of the vehicle. Clean vehicle according to use instructions of hazardous chemical.</td>
</tr>
</tbody>
</table>

Figure 3.10 - When exposed to hazardous chemicals, clean exterior and interior of vehicle daily to keep free of the accumulation of visible dirt and contamination.

1. Clean operator’s station to maintain unobstructed visibility of all windows and mirrors, and safe operation of all controls.

<table>
<thead>
<tr>
<th>NOTICE!</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directing pressurized water at electronic/electrical components, bearings and hydraulic seals or other sensitive parts and components may cause product malfunctions. Reduce pressure and spray at 45 to 90 degree angles.</td>
</tr>
</tbody>
</table>

### HANDLE BATTERIES SAFELY

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sulfuric acid in battery electrolyte is poisonous. It can burn skin, eat holes in clothing, and cause blindness if it contacts eyes.</td>
</tr>
</tbody>
</table>

Figure 3.11 - Lead acid batteries generate flammable and explosive gases. Keep sparks and flame away from batteries. Do not smoke.

If acid contacts eyes, skin or clothing, flush with water immediately. Seek immediate medical attention if acid contacts eyes.

### PROPER TIRE MAINTENANCE

Figure 3.12 - Never weld on a wheel or rim that has a tire on it.

Never attempt to mount or remove a tire unless using the proper equipment, tire safety cage, instructions, training, and you are qualified to perform the work safely. Failure to follow the correct procedures when mounting a tire on a wheel or rim can cause an explosion and serious injury.

Tire service procedures must be performed by trained and qualified personnel.
General Safety Rules

Storage

PARK VEHICLE SAFELY

Figure 4.1 - When leaving the vehicle unattended for any reason, be sure to:

- Shut down PTO.
- Shut off vehicle's engine, and unit's engine if applicable.
- Place vehicle transmission in “Neutral” or “Park”.
- Set parking brake firmly.
- Remove ignition key and take it with you.
- Block wheels.

These actions are recommended to avoid unauthorized use, runaway, vandalism, theft and unexpected operation during startup.

SUPPORT MACHINE PROPERLY

Figure 4.2 - When machine is removed from vehicle, always store on adequate supports on a firm level surface. Improper supporting or storage of spreader may cause machine to fall, resulting in serious injury or death.

Never use lifting device to free machine from a chassis, storage stands or frozen ground, or to lift the chassis in any way. Shock loading is prohibited and sudden accelerations must be avoided. Lifting in such a manner could result in injury or machine damage.

DISPOSE OF WASTE PROPERLY

Figure 4.3 - Improper disposal of waste can threaten the environment and ecology. Potentially harmful waste used with equipment include items such as fuel, oil, filters and batteries.

Use leakproof containers when draining fluids. Do not use food or beverage containers that may mislead someone into drinking from them. Do not pour waste onto the ground, down a drain, or into any water source.

Inquire on proper disposal methods from your local environmental or recycling center, or from your local dealer.
Safety Decals

Safety Decal Maintenance

Keep safety decals and signs clean and legible at all times.

Replace safety decals and signs that are missing or have become illegible.

Replaced parts that displayed a safety sign should also display the current sign.

Safety decals or signs are available from your dealer's Parts Department or from New Leader Manufacturing by calling (800) 363-1771.

Safety Decal Installation

Clean Surface
Wash the installation surface with a synthetic, free-rinsing detergent. Avoid washing the surface with a soap containing creams or lotion. Allow to dry.

Position Safety Decal
Decide on the exact position before application. Application marks may be made on the top or side edge of the substrate with a lead pencil, marking pen, or small pieces of masking tape. NOTE: Do not use chalk line, china marker, or grease pencil. Safety decals will not adhere to these.

Remove the Liner
A small bend at the corner or edge will cause the liner to separate from the decal. Pull the liner away in a continuous motion at a 180-degree angle. If the liner is scored, bend at score and remove.

Apply Safety Decal
Tack decal in place with thumb pressure in upper corners. Using firm initial squeegee pressure, begin at the center of the decal and work outward in all directions with overlapping strokes. NOTE: Keep squeegee blade even—nicked edges will leave application bubbles. Pull up tack points before squeegeeing over them to avoid wrinkles.

Remove Pre-mask
If safety decal has a pre-mask cover remove it at this time by pulling it away from the decal at a 180 degree angle. NOTE: It is important that the pre-mask covering is removed before the decal is exposed to sunlight to avoid the pre-mask from permanently adhering to the decal.

Remove Air Pockets
Inspect the decal in the flat areas for bubbles. To eliminate the bubbles, puncture the decal at one end of the bubble with a pin (never a razor blade) and press out entrapped air with thumb moving toward the puncture.

Re-Squeegee All Edges
1. **CAUTION: TO AVOID INJURY OR MACHINE DAMAGE:**
   - Do not operate or work on this machine without reading and understanding the operator’s manual.
   - Keep hands, feet, hair and clothing away from moving parts.
   - Do not allow riders on machine.
   - Avoid unsafe operation or maintenance.
   - Disengage power takeoff and shut off engine before removing guards, servicing or unclogging machine.
   - Keep unauthorized people away from machine.
   - Keep all guards in place when machine is in use.
   - If operator’s manual is missing, contact your local New Leader dealer or print a new copy from [www.highwayequipment.com](http://www.highwayequipment.com).

2. **DANGER: MOVING PART HAZARD**
   **To prevent death or serious injury:**
   - Stay out of box while conveyor is moving.
   - Disconnect and lock out power source before adjusting or servicing.
   - Do not ride on the spreader.

3. **CAUTION: HAZARDOUS MATERIALS**
   **To avoid injury or machine damage:**
   - Materials to be spread can be dangerous.
   - Improper selection, application, use or handling may be hazardous to persons, animals, crops or other property.
   - Follow instructions and precautions given by material manufacturer.

3A. **WARNING: HAZARDOUS MATERIALS**
   **To avoid injury:**
   - Cancer and Reproductive Harm - [www.P65Warning.ca.gov](http://www.P65Warning.ca.gov)
4. **WARNING: FALLING HAZARD**
   To prevent death, serious injury or machine damage:
   - Do not climb or stand on guard.
   - Do not place objects on fenders.
   - Keep off fenders. They are not intended to carry loads.

5. **WARNING: MOVING PART HAZARD**
   To prevent death or serious injury:
   - Close and secure guards before operating machine.
   - Do not stand or climb on machine.
   - Disconnect and lockout power source before adjusting or servicing.
   - Keep hands, feet and hair away from moving parts.

6. **DANGER: GUARD IS MISSING WHEN THIS IS VISIBLE**
   To prevent death or serious injury:
   - Do not operate this unit without guard in place.
7. WARNING: HIGH-PRESSURE FLUIDS

To prevent death or serious injury:
- Do not check for leaks with hands while system is operating as high pressure oil leaks can be dangerous!
- Relieve system pressure before disconnecting hydraulic lines or working on system.
- Make sure all hydraulic fluid connections are tight and all hydraulic hoses and lines are in good condition before applying pressure to the system.
- Wear protective gloves and safety glasses or goggles when searching for leaks. Use wood or cardboard instead of hands.
- Do not use hydraulic lines for hand holds or steps.
- Components may be hot.
- Get immediate medical attention if skin is pierced with fluid as gangrene may result.

8. DANGER: FLYING MATERIAL AND ROTATING SPINNER HAZARD

To prevent death or serious injury:
- Wear eye protection.
- Stop machine before servicing or adjusting.
- Keep bystanders at least 60 feet away.
1. **CAUTION: BRAKING SYSTEM REQUIREMENTS**

To prevent injury or machine damage, per ANSI/ASAE S365.8 MAY 2007:

Do not tow equipment that **has** brakes:
- at speeds over 32mph (50km/hr); or
- at speeds above that recommended by the manufacturer; or
- that, when fully loaded, has a weight more than 4.5 times the weight of the towing unit.

Do not tow equipment that **does not have** brakes:
- at speeds over 20mph (32km/hr); or
- at speeds above that recommended by the manufacturer; or
- that, when fully loaded, has a weight over 3300 lbs (1496kg) and more than 1.5 times the weight of the towing unit.

305281-B

2. **CAUTION: TOWING REQUIREMENTS**

To prevent injury or machine damage:

Tow only with tractors equipped with CAT IV hitch and brakes. Towing with light or medium duty trucks may result in loss of control, causing damage or injury.

313858-A

3. **CAUTION: TIPPING HAZARD**

To prevent injury or machine damage:

Make sure material is not concentrated at the rear of the machine before unhitching. Material at the rear of the machine may cause the trailer hitch to tip upward.

305289-A
### 4. CAUTION: DO NOT EXCEED GOVERNMENT WEIGHT RESTRICTIONS

**To prevent injury or machine damage:**
Consult federal, state and local laws to ensure the gross weight of any one axle of a vehicle, or of a combination of vehicles, operated on the highways, does not exceed government weight restrictions.

### 5. WARNING: FALLING HAZARD

**To prevent death, serious injury or machine damage:**
- Do not climb or stand on tongue.

### 6. NOTICE: TRAILER TIRE SPEED

**To avoid injury or machine damage:**
- Only operate spreader with tire pressures, road speeds and payloads in accordance with decal. Refer to “Operations” section of this manual for details.

### 7. NOTICE: MACHINE LUBRICATION

**To avoid machine damage and premature deterioration:**
- Periodically lubricate the machine components at the front and rear remote grease banks.
- See “Lubrication & Maintenance Chart” in this manual for details.
This page is intentionally left blank.
1. NOTICE: SPREAD PATTERN TESTING

To obtain optimal machine performance:

Before spreading material, spread pattern tests must be conducted to properly adjust the spread pattern. Refer to manual for adjustment instructions. A spread pattern test kit is available from your New Leader dealer.

Wind, humidity, rain and other adverse weather conditions can affect spread pattern, resulting in uneven crop growth and loss of yields.

THE MANUFACTURER OF THIS SPREADER WILL NOT BE LIABLE FOR MISAPPLIED MATERIAL DUE TO AN IMPROPERLY ADJUSTED SPREADER OR ADVERSE WEATHER CONDITIONS.

It is recommended that a spread pattern test be conducted prior to each spreading season, after any spreader maintenance, and periodically during spreading season. Spread pattern tests must be conducted whenever a new product is to be applied.

This unit is intended for dispensing micronutrients and seeds only - NOT HERBICIDES. The manufacturer is not liable for damage resulting from improper use.

2. NOTICE: CONVEYOR CHAIN TENSION

To avoid machine damage and premature deterioration:

- Periodically inspect conveyor chain tension to ensure proper tension is maintained.
- See “Lubrication & Maintenance” section of this manual for details.
3. NOTICE: MACHINE LUBRICATION

To avoid machine damage and premature deterioration:

- Periodically lubricate the machine components at the front and rear remote grease banks.
- See “Lubrication & Maintenance Chart” in this manual for details.
This page is intentionally left blank.
Hydraulic Requirements

- Low pressure drop motor return port.
- Zero pressure case drain port.
- Equipped with hydraulic trailer brake system.

Hitch Requirements

- The implement is equipped with a category 4 receiver hitch, requiring a 2” (51mm) hitch pin.

Electrical Requirements

- The implement is equipped with a standard 7-pin connector for operation of lights.
- See “ISOBUS Connections” for controller connections.

Controller Requirements

The spreader is equipped with an ISO 11783 compatible control system and will connect to any ISO 11783 compliant virtual terminal with a task controller that supports multi-channel dry granular applicators.
Implement Preparation and Connection

**DANGER** DO NOT wear loose clothing. Keep hands and other body parts away from connecting parts of tractor and implement. Entanglement could cause serious injury.

**DANGER** DO NOT stand on PTO, PTO driveline, tongue, or draw bar. Falling could cause death or serious injury.

**WARNING** Make sure area is clear between the tractor and implement when backing up to implement.

**WARNING** DO NOT use intermediate support as attaching point.

**NOTICE!** Make sure safety chain is stored safely when not in use.

**NOTICE!** Inspect the cleanliness of connecting parts. All areas must be free of debris and dirt to ensure a secure connection.

Implement Hitch Adjustment

Factory installs implement hitch in lower three holes of hitch holder. Dealer/customer must adjust hitch position to match tractor drawbar. When hitch is in correct position, tighten grade 8 bolts to torque per “Standard Torques” chart in this manual.

**NOTICE!** Hitch MUST be fastened to trailer with all three bolts.

Implement Connection

1. Check for visible wear and make sure hitch and draw pin are clear of debris and dirt.
2. Crank the jack to adjust hitch height to match the tractor.
3. Pull out draw pin on tractor hitch. (Figure 1)
4. Back up tractor and align holes on implement hitch and hitch on tongue of implement. (Figure 2)
5. Insert draw pin through implement hitch and tractor drawbar. Insert hitch pin and lock to secure. (Figure 3)
6. Lower handle on draw pin into locking position. Insert securing pin through hole at bottom of draw pin and lock. (Figure 4)
7. Lube implement hitch.
8. Retract jack to storage position.

10. On left side of hitch, loop safety chain through tractor intermediate support (Figure 5).
11. On left side of hitch, loop safety chain around tractor drawbar (Figure 6).
12. Hook on chain (Figure 7). Allow only adequate slack for articulation.
13. Slide clasp on safety chain to secure locked position (Figure 8). Excess chain will hang between tractor and implement (Figure 9).

   NOTE: Replace safety chain if one of more links are damaged, deformed or damaged.
Connecting Implement

Power Take-Off Connection

1. Inspect, clean and lubricate PTO and PTO driveline.
2. Inspect all guards, making sure they are in proper working order.
3. Lift tractor’s PTO cover.
4. Slide PTO driveline coupler onto tractor PTO and lock into place on driveline groove (Figure 10-12).
5. Place tractor’s PTO cover back into lowered position.
6. Attach PTO driveline guard chain to tractor.

7. Make sure all hoses and wires run through the hose support to remain clear of PTO driveline. If needed, add additional clamps. (Figure 13)

NOTICE!
Route all hoses and wiring through hose support (Figure 13). Avoid entanglement of hoses and wiring with the PTO driveline, hitch, or tongue. Damage to equipment can occur if hoses and wires are not routed correctly.
ISOBUS Connections

A: Factory Supplied CAN-ISO Connector
Connects to: ISOBUS Implement Extension Harness, Supplied with implement.

- Pin 1 - Battery Ground
- Pin 2 - ECU Return (ECU Ground)
- Pin 3 - 60-amp fused power
- Pin 4 - ECU Power (Switched 12v)
- Pin 5 - N/A
- Pin 6 - TBC Power
- Pin 7 - TBC Return
- Pin 8 - ISO-BUS Can High
- Pin 9 - ISO-BUS Can Low

Connects to: TR3000 Main Harness, supplied with implement.

- Pin 1 - Hydraulic cooler fan power (Switched 12v)
- Pin 2 - Hydraulic cooler fan ground
- Pin 3 - N/A
- Pin 4 - N/A

30-amp power on pin 1 must be fused at battery.
Hydraulic Hose Installation Guide

1. Use elbows and adapters in the installation to relieve strain on the assembly, and to provide easier and neater installations that are accessible for inspection and maintenance. Remember that metal end fittings cannot be considered as part of the flexible portion of the assembly.

2. Install hose runs to avoid rubbing or abrasion. Clamps are often needed to support long runs of hose or to keep hose away from moving parts. It is important that the clamps be of the correct size. A clamp that is too large will allow the hose to move in the clamp causing abrasion at this point.

3. In straight hose installations allow enough slack in the hose line to provide for changes in length that will occur when pressure is applied. This change in length can be from +2% to -4%.

4. Do not twist hose during installation. This can be determined by the printed layline on the hose. Pressure applied to a twisted hose can cause hose failure or loosening of the connections.

5. Keep hose away from hot parts. High ambient temperature will shorten hose life. If you cannot route it away from the heat source, insulate it.

6. Keep the bend radii of the hose as large as possible to avoid hose collapsing and restriction of flow. Follow catalog specs on minimum bend radii.

(Used with the permission of The Weatherhead Company.)
The Model NL450C is a L5034G4 spreader mounted on the TR3000 trailer. It is intended for spreading feedlot composted manure, waste water sludge, industrial waste, paper mill waste, compost, marl, poultry litter and fly ash.

The TR3000 is designed for attachment to specially equipped tractors. It’s equipped with brakes and floatation tires on a walking beam suspension.

The spreader is powered hydraulically and provides independent variable speed control for the spinner and full automatic ground speed control for the conveyor by means of a motorized valve with shaft sensor. Tandem gear type hydraulic pump provides the power to drive the spinner by means of a tractor PTO. The conveyor chain is driven by the tractor hydraulics.

The 34” wide (86 cm) conveyor runs the full length of the hopper bottom to deliver material to the spinners through a hydraulically adjustable metering gate at the rear of the hopper body. A feedgate sight gauge allows monitoring of the feedgate opening from the cab. The conveyor is driven by two orbital type hydraulic motors mounted to a 6 to 1 ratio spur gear case. Two conveyor options are available: pintle type chain joined by cross bars every third link (#1) or every other link (#2).

The distributor spinner assembly has two 30” (76 cm) diameter discs. Each disc has the option of four to six formed and heat treated fins that are adjustable to radial angle. The spinner is fully adjustable by means of a rotating handle.

This product is intended for commercial use only.
Introduction
Bin 1: Main holding bin for material.

Conveyor: Conveys material to rear of unit.

Cross Tubes: Supports body, attaches to trailer frame. Transfers weight from Main Hopper to Trailer.

Enclosure: Houses spreader control modules, protects them from the elements

Feedgate: Adjustable gate mounted into Rear Endgate. Allows for variable rates of material flow by adjusting hydraulic feedgate to desired height.

Hillside Divider: Ensures balanced flow of material across conveyor when on hillsides or uneven terrain.

Lift Hooks: Used to lift unit or insert with appropriately rated lifting device.

Material Divider: Ensures uniform spread pattern by directing material off of conveyor onto spinner discs.

Rear Endgate: Welded endgate (Rear based on direction of travel). Holds mounted Feedgate, allowing for rear release of material from bin.

Sill: Base of Main Hopper side walls. Contains Conveyor and supports machine walls.

Spinner Assembly: Contains adjustable G4 Spreader system, consisting of hydraulic spinners used for dispersal of various materials at different positioned settings allowing for consistent, even spread patterns across a wide variety of material with a high rate of accuracy.

Spinner Deflectors: Deflect material away from machine.

Spinner Guards: Upper and Lower guards, protects operators from spinner discs. Must be in place during any operation.

Stake: Side support for machine walls.
*Height dimensions shown with static loaded, OEM-size tires.

<td>608 (17.2)</td>
</tr>
</tbody>
</table>

**NOTICE!** Please consult federal, state, and local weight laws and tire manufacturer’s ratings to ensure neither government weight restrictions nor tire load ratings are exceeded.
Initial Startup

WARNING  Stand clear of moving machinery.

NOTE: Do not load spreader with material.

1. Check entire unit to make sure all fasteners are in place and properly tightened per “Standard Torques” section in this manual.
2. Make sure no other persons are in vicinity of spreader.
3. Make sure no loose parts are in unit or on conveyor or spinner.
4. Check oil level in hydraulic reservoir; fill as necessary. Refer to “Lubricant & Hydraulic Oil Specifications” in Lubrication & Maintenance section of this manual for proper oil. Completely open reservoir valves.
5. Start engine and turn on hydraulics. Allow hydraulics to circulate until oil is warm.
7. Perform all calibration procedures for spinners and all installed bins. Refer to “Component Calibration” in Controller Operations section.
8. Run spinner at 300 RPM. Allow to run until spinner is operating smoothly.
9. Run conveyor at 20 RPM and spinner at 300 RPM. Run until conveyor is operating smoothly.
10. Run conveyor at 20 RPM and spinner at 700 RPM. Allow both conveyor and spinner to run until operating smoothly.
11. Enable boundary left and right and verify that RPM adjust accordingly.
12. Run conveyor at 0 RPM and spinner at 0 RPM. Make sure both conveyor and spinner do not move.
13. Shut system down.

WARNING  DO NOT check leaks with hands while system is operating as high pressure oil leaks can be dangerous! If skin is pierced with hydraulic fluid at high pressure seek immediate medical attention as fluid injected into the skin could cause gangrene if left untreated. Relieve pressure before disconnecting hydraulic lines or working system. Make sure all hydraulic fluid connections are tight and all hydraulic hoses and lines are in good condition before applying pressure to the system. Wear protective gloves and safety glasses or goggles when working with hydraulic systems.

WARNING  DO NOT check for leaks adjacent to moving parts while system is operating as there may be danger of entanglement!

14. Check all connections in hydraulic system to make sure there are no leaks.
15. Check hydraulic oil reservoir and refill to maintain level at mid-point of gauge.

Unit is now ready for field testing.
NOTE: It is recommended that spread pattern tests be conducted prior to each spreading season, after any spreader maintenance, before applying a new product, and periodically during the spreading season. Spread pattern tests must be performed for each product, blend and application rate. See “Spread Pattern” section of this manual for details.

1. Make sure unit has been properly serviced and is in good operating condition. It is recommended to run the spreader prior to loading material to ensure acceptable operation.
2. Set machine settings in controller per Controller Operations section in this manual.
3. Select or create material profile for material and application.
4. Adjust feedgate to appropriate setting.
5. Spread pattern test for any new material.
6. Fill unit with material to be spread.
7. Engage hydraulics.
8. Begin spreading.

CAUTION Drive only at speeds which permit secure control of vehicle!
Anti-Slab Chain Storage / Hillside Divider Panel

### WARNING

Drive at a reasonable and safe speed according to weather, field and road conditions. Loss of tractor or implement control could cause serious injury or death.

### NOTICE!

Consult federal, state and local weight laws to ensure government weight, speed, and road restrictions are not exceeded.

1. Maximum payload assumes evenly distributed product in a single bin.
2. Consult federal, state and local laws to ensure the gross weight on any one axle or combination of axles, operated on highways, does not exceed government weight restrictions.
3. This chart is applicable for OEM tires and rims.
Implement Maneuvering

**WARNING**

Make sure the area behind the trailer is clear of obstructions and personnel. Turning or backing may result in limited visibility. Check blind spots. Back and/or turn cautiously. Failure to do so could result in death, serious injury or damage to the implement.

**WARNING**

Maintain reasonable speeds. Consider rough terrain including obstacles such as terraces, ditches, and approaching angles. Know the limits of hitch angles. Failure to do so could result in tipping of implement, bottoming of suspension, jack-knifing, spillage or loss of material and other damages to the implement and/or tractor, resulting in serious injury or death.

Backing and Turning Tips

**NOTICE!**

Turning and backing at sharp angles will cause the tractor and implement to jack-knife. DO NOT exceed maximum turning angle of 60°.

Maximum Hitch Angles and Walking Beam Travel

**CAUTION**

DO NOT max out suspension travel. Damage may occur to implement. The manufacturer will not be liable for damage to implement due to improper usage.

---

![Diagram](image)

**Figure 4 - Maximum Hitch Angles**
Rear Pulling Lugs

**NOTICE!** Do not pull implement sideways—always pull straight. Always disconnect tractor from implement before using rear lugs. Otherwise, damage to implement may occur.

**NOTICE!** Failure to raise jack before pulling stuck implement will destroy jack.

If implement becomes stuck in field and cannot be freed by towing through:

1. Empty spreader, shut off tractor power and lower jack.
2. Disconnect implement from tractor.
3. Hook appropriately rated chain to both the left and right hand rear pulling lugs as shown in Figure 5.
4. Fasten chains to tractor.
5. Raise jack.
6. Engage tractor to dislodge implement.
This page is intentionally left blank.
Preventative Maintenance Pays!

The handling and spreading of commercial fertilizers is a most severe operation with respect to metal corrosion. Establish a frequent, periodic preventative maintenance program to prevent rapid damage to spreading equipment. Proper cleaning, lubrication and maintenance will give you longer life, more satisfactory service and more economical use of your equipment.

WARNING Shut off all power and allow all moving parts to come to rest before performing any maintenance operation.

Hydraulic System

Proper oil in the hydraulic system is one of the most important factors for satisfactory operation. Utmost cleanliness in handling the oil cannot be stressed enough. Keep hydraulic oil in original closed containers, clean top of container before opening and pouring, and handle in extremely clean measures and funnels.

Refer to “Lubricant & Oil Specifications” on page <?> for selection of the proper hydraulic fluid for use in the hydraulic system.

WARNING DO NOT check leaks with hands while system is operating as high pressure oil leaks can be dangerous! If skin is pierced with hydraulic fluid at high pressure seek immediate medical attention as fluid injected into the skin could cause gangrene if left untreated. Relieve pressure before disconnecting hydraulic lines or working system. Make sure all hydraulic fluid connections are tight and all hydraulic hoses and lines are in good condition before applying pressure to the system. Wear protective gloves and safety glasses or goggles when working with hydraulic systems.

WARNING DO NOT check for leaks adjacent to moving parts while system is operating as there may be danger of entanglement!

Check hydraulic oil daily by means of sight gauge on hydraulic reservoir. Add oil as necessary to maintain level around mid-point of sight gauge. Periodically inspect hoses and fittings for leaks.

NOTICE! Change hydraulic oil filter after first week (or not more than 50 hours) of operation on a unit.

Controller will warn when filter is restricted. Change filter when warning sounds.

Drain hydraulic tank through drain plug (not through suction outlet), flush, and refill, and change filter element annually. Oil and filter should also be changed whenever oil shows any signs of breaking down under continued high-pressure operation. Discoloration of oil is one sign of breakdown.
HYDRAULIC HOSE

Hose assemblies in operation should be inspected frequently for leakage, kinking, abrasion, corrosion or other signs of wear or damage. Worn or damaged hose assemblies should be replaced immediately. When replacing, use hoses of same or better rating and construction.

**WARNING**
Testing should be conducted in approved test stands with adequate guards to protect the operator.

---

**Clean**
Clean assembly by blowing out with clean compressed air. Assemblies may be rinsed out with mineral spirits if the tube stock is compatible with oil, otherwise hot water at 150°F (65.55° C) maximum may be used. Ensure all are dry before assembly.

**Inspect**
Examine hose assembly internally for cut or bulged tube, obstructions, and cleanliness. For segment style fittings, be sure that the hose butts up against the nipple shoulder; band and retaining ring are properly set and tight, and segments are properly spaced. Check for proper gap between nut and socket or hex and socket. Nuts should swivel freely. Check the layline of the hose to be sure the assembly is not twisted. Cap the ends of the hose with plastic covers to keep clean.

**Test**
The hose assembly should be hydrostatically tested at twice the recommended working pressure of the hose. Test pressure should be held for not more than one minute and not less than 30 seconds. When test pressure is reached, visually inspect hose assembly for: 1. Any leaks or signs of weakness. 2. Any movement of the hose fitting in relation to the hose. Any of these defects are cause for rejection.

---

**Storage and Handling**

Hose should be stored in a dark, dry atmosphere away from electrical equipment, and the temperature should not exceed 90° F (32° C).
**Conveyor Chain**

**WARNING**
Stay out of the spreader. If it’s necessary to enter the spreader, return to the shop, empty body, turn off all power, set vehicle brakes, lock engine starting switch and remove keys before entering. Tag all controls to prohibit operation. Tags should be placed, and later removed, only by person working in the body.

Hose down unit and remove any material build-up on sprockets and under chain.

**NOTICE!**
The conveyor will move away from the bottom panel if material accumulates under the conveyor or on the sprockets. The more material that accumulates, the closer the chain will come to the chain shields. If the conveyor should catch a chain shield, it could permanently damage the conveyor, the chain shields or the unit. Do not remove material while conveyor or spinner is running!

**Lubrication**
Make sure unit is clean and completely dry. Lubricate conveyor chain via display at an interval of 10 hours of spreading, or at the end of each day of usage.

**Tension**
Proper chain tension is a factor in chain and sprocket life. Measuring from rear of unit, conveyor should touch at 36” - 40” (91 - 102cm) mark, and top of chain should appear between MIN and MAX lines in sight window (Figure 1). If manual adjustments need to be made, on valve block, loosen jam nut, turn counterclockwise to lower tension, or turn clockwise to increase tension (Figure 2). All tension adjustments must be made when machine is unloaded and conveyor running 15-20 RPM.
Lubrication & Maintenance

Over-tensioning of conveyor chain will lead to excessive load on the system which will cause excessive chain and sprocket wear and can cause extremely high starting pressures. Under-tensioning allows conveyor chain to “wrap” around drive sprockets and not exit sprocket freely, causing excessive excessive chain stretch and surging of the conveyor which will result in interrupted flow of material to the spinners.

Proper Tension
Main Bin Conveyor
36” to 40”
(914mm - 1016mm)
Spinner Fins

Visually inspect spinner fins (Figure 4) daily for build-up of material and wear. Spinner discs and fins must be kept clean and polished. Even a small build-up of material on a spinner can significantly affect the spread pattern. Rough, bent or worn fins will produce bad spread patterns. Replace worn fins or discs as needed. See Fin Kit Installation Instructions for replacement part numbers and instructions.

Spinner Deflectors

Visually inspect spinner deflectors (Figure 5) daily for build-up of material and damage. Clean as needed. Even a small build-up of material on a spinner deflector can affect the spread pattern. If damaged, bent or otherwise, replace. See Parts List in this manual for replacement part numbers.

Material & Hillside Flow Dividers

Visually inspect material divider (Figure 6) and hillside flow dividers (as equipped) daily for build-up of material and wear. Any build-up of material on divider components can affect performance. Clean as needed. Replace worn or damaged parts as necessary. See Parts List in this manual for replacement part numbers.
Conveyor Gearcase

Drain oil in a new unit after first two weeks (or not more than 100 hours) of operation, and flush gear case thoroughly with light oil. Refer to “Lubricant and Hydraulic Oil Specifications” section for proper grade oil and recommended amounts of lubricant. After initial change, oil should be changed every 2,000 hours of operation or annually, whichever occurs first.

Check gearcase oil level monthly.

Lubrication of Bearings

Grease in a bearing acts to prevent excessive wear of parts, protects ball races, and balls from corrosion and aids in preventing excessive heat within the bearing. It is very important the grease maintain its proper consistency during operation. It must not be fluid and it must not channel.

Make sure all fittings are thoroughly cleaned before grease is injected. Points to be lubricated by means of a grease gun have standard grease fittings.

Lubricate bearings by pumping grease slowly until it forms a slight bead around the seals. This bead indicates adequate lubrication and also provides additional protection against the entrance of dirt.

Fasteners

Tighten all screws fasteners to recommended torque’s after first week of operation and annually thereafter. If loose fasteners are found at anytime, tighten to recommended torque. Replace any lost or damaged fasteners or other parts immediately. Check body mounting hardware every week.

Check torque on body mounting, hitch, wheels and suspension hardware every week. Tighten front mount hardware so springs are compressed from 3.5” - 3.75” (8.89 - 9.53 cm) (Figure 7A). Tighten each back mount hardware to 80 - 90 ft-lb (108.5 - 122 N-m) (Figure 7B).

![Figure 7A - Front, Middle Mount Spring Compression](image1)
![Figure 7B - Bolt Torque on Rear Mount](image2)
**Trailer Brakes**

**WARNING!** Perform maintenance on level surface with wheels blocked. There is no parking brake on the TR3000. Block the wheels prior to unhitching or any maintenance of the TR3000. Uncontrolled movement of the trailer could cause death or serious injury.

Using sight window on drums’ dust shields, adjust brakes, tighten slack adjuster until brake pads touch brake drums, then back off 1/4 turn.

Brake noise and/or sluggish brake response may indicate air in the brake line. To correct this problem perform the bleeding procedure listed below.

**Bleeding Procedure:**

Modulate tractor brakes to low pressure and flow.

On top of rams, loosen bleeder plugs to fill system.

Attach supply line to tractor. Press brake pedal or operate a pump to charge system.

**DANGER** Do not check leaks with hands while system is operating as high pressure leaks can be dangerous! If skin is pierced with hydraulic fluid at high pressure seek immediate medical attention as fluid injected into the skin could cause gangrene if left untreated. Relieve pressure before disconnecting hydraulic lines or working with system. Make sure all hydraulic fluid connections are tight and all hydraulic hoses and lines are in good condition before applying pressure to the system. Wear protective gloves and safety glasses or goggles when working with hydraulic systems.

When fluid is seeping from bleeder holes, release brake pedal or turn off hydraulic power unit pump and install bleeder plugs.

Loosen one bleeder plug a 1/2 turn and apply brakes to remove remaining air.

Tighten bleeder plug.

Make sure ram is free of air.

Complete steps 5-7 for all four rams.

Allow system to set for five or more minutes. This will allow any additional trapped air to rise to the top of the system.

Break the line at the highest point. This is located in the center of the bulkhead assembly.

**NOTICE!** Fittings must be tightened under hydraulic pressure or air may be drawn back into system.

Apply pressure to brake to remove any air from the system and tighten fittings.

Apply brakes and check for leaks. Make sure all rams are fully extended while applying braking force to brake drums. If done correctly, the ram and slack adjuster will be at 90° to each other (Figure 8).

The ram should extend approximately 1 1/2 inch (38 mm) to 1 3/4 inch (44 mm).

If brakes chatter or rams do not fully extend repeat steps 5-12.

When complete, rams must be fully retracted.
Tires

**NOTICE!** Inspect tires and wheels daily for wear and/or loose hardware.

**WARNING** Service of tires and rims can be dangerous. Follow all safety rules. Only specialized personnel should mount tires. Use proper equipment and procedures. Damaged tires can explode causing injury. Falling and/or rolling tires may cause injury.

**WARNING** Do not over inflate tires. DO NOT stand in front of or over tires when inflating. If necessary, use a clip-on air chuck and extension hose. Over-inflating can cause tire to explode, causing serious injury. Always inflate tire/rim assembly with an OSHA approved cage or restraining device. Tire and rim diameters should always match.

Always maintain correct tire pressure. Set tire pressure at 20 PSI (1.38 bar) to minimize ground compaction. See “General Operating Procedures” section.

Check tires frequently during extreme temperatures.

Refer to tire manufacturer for additional information.

**Wheels & Lug Nuts**

**Wheel Installation**

**CAUTION** Retorque wheel studs after 10 hours of operation.

Make sure brakes are not engaged.

Check all parts are free of dirt and grease. Make sure all parts are free of damage. The hub or drum mounting face must be cleaned and kept flat.

Ensure that the brake drum is on the pilots’ raised step, seated fully against the hub.

Clean the wheel’s center hole as necessary so it will fit easily on the hub pilots.

Apply two drops of oil between the nuts and flange and two drops to the last 2 or 3 threads at the end of each stud. Lightly lubricate the pilots on the hub to ease wheel installation and removal.

**NOTICE!** DO NOT get lubricant on the mounting face of the drum or wheel. This will cause hardware to loosen prematurely.

Position hub with one pilot at 12 o’clock position. Place wheel onto hub carefully so as not to damage stud threads. Make sure wheel is fully seated against drum.

Install hardened spacer and nuts, finger-tight, at 12 o’clock and 6 o’clock positions. Rotate wheel 180° and make sure wheel is fully seated against drum. Repeat as needed. Install spacers and nuts finger-tight on remaining studs.
Tighten nuts to 50 ft-lb (67.8 N-m) following a crisscross sequence as shown in Figure 9. After the wheel is installed inspect the seating of the wheels on all four pilots and turn the wheel checking for irregularity of the wheel assembly. This will ensure the wheel is seated on the pilots and flat against the drum. Tighten all nuts to 450-500 ft-lb (610.2-678 N-m) using the crisscross sequence as shown in Figure 32. Repeat torque sequence until all nuts are consistent to 450-500 ft-lb (610.2-678 N-m).

End-of-Season Storage

**WARNING** Never store implement with material in bin. Implement could tip and crush or strike someone causing serious injury or even death.

1. Refer to “Pre- & Post-Season Checklists” at the end of this section. Complete End-of-Season Checklist as required.
2. Store implement indoors on a hard, level surface, with wheels blocked to prevent rolling.
3. Lower jack to support the implement so that it is level. Ensure that the jack is placed securely on a hard surface.
4. Place all power connections in storage positions as shown in Figure 10:
   - Store light connector in storage bracket located on hose guide (A).
   - Store ISOBUS connector in receptacle (B).
   - Store hydraulic hoses in provisions on hose guide (C).
5. Disconnect implement from tractor.

Clean Up

**NOTICE!** High pressure wash can inject water and/or fertilizer into control components, causing damage. Use caution when cleaning these areas.

Thoroughly wash unit every two to three days during the operating season to maintain minimal maintenance operation. Hose unit down under pressure to free all sticky and frozen material.

It is important the unit be thoroughly cleaned at the end of each operating season. All lubrication and maintenance instructions should be closely followed. Repaint worn spots to prevent formation of rust.
This page is intentionally left blank.
NOTICE! The lubricant distributor and/or supplier is to be held responsible for results obtained from their products. Procure lubricants from distributors and/or suppliers of unquestionable integrity, supplying known and tested products. Do not jeopardize your equipment with inferior lubricants. No specific brands of oil are recommended. Use only products qualified under the following oil viscosity specifications and classification recommended by reputable oil companies.

Hydraulic System

Use premium quality lubricants with 100-200 SUS or 20-43 cSt viscosity at operating temperatures. The hydraulic fluid’s specifications in the table below are for normal operating conditions. Extreme environments or dirty conditions may require the use of different oils. Consult your New Leader dealer or the Product Support Department at New Leader Manufacturing for systems operating outside normal conditions.

<table>
<thead>
<tr>
<th>Ideal Oil Operating Temperature</th>
<th>115-158°F (46.11-70° C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recommended Premium Lubricant</td>
<td>Multi-Purpose Agriculture Hydraulic &amp; Transmission Oil</td>
</tr>
</tbody>
</table>

Lubricant Specifications

- **Viscosity Index**: Greater than 130
- **Viscosity at 40°C, cst**: Less than 68
- **Viscosity at 100°C, cst**: Greater than 9

Acceptable Fluid Example: Mobil 424

Gearcase Lubricant

Lubricate these assemblies with non-corrosive type extreme pressure (E.P.) gear oil conforming to MIL-L2105 B multi-purpose gear lubricating oil requirements (API Service GL 4) based on ambient temperatures listed below. Refill gearcase with one and a half (1-1/2) pints (.70 liters) of recommended lubricant.

<table>
<thead>
<tr>
<th>Ambient Temperature</th>
<th>Oil Type</th>

<td>Below 40°F (4.4°C)</td>
<td>SAE 80 E.P.</td>
</tr>
<tr>
<td>40° - 100° F (4.4° - 38 °C)</td>
<td>SAE 90 E.P.</td>
</tr>
<tr>
<td>Above 100° F (38° C)</td>
<td>SAE 140 E.P.</td>
</tr>
</tbody>
</table>

Grease Gun Lubricant

Use a waterproof ball and roller bearing lithium base lubricant with a minimum melting point of 300°F (148.8° C). This lubricant should have a viscosity which assures easy handling in the pressure gun at prevailing atmospheric temperatures. The grease should conform to NLGI No. 2 consistency.

Chain Oiler Mixture

Use a mixture of 75% diesel fuel mixed with 25% SAE 10 engine oil (use clean oil, not pre-used oil).

Pre- & Post-Season Checklists

IMPORTANT! Do not operate or work on machine without reading and understanding the operator’s manual.

Before starting engine/before starting machine operation

- Program rate controller and document settings
- All stop, tail, and turn lights function properly
- Tire pressures are equal on each side of chassis
- Battery condition and connection
- Electrical connections are tight and secure
- All fasteners are secure
- Inverted “V” is secure and installed properly
- Sensor(s) are functioning properly
- Lubricate all grease fittings
- Hydraulic oil level and line connections are tight
- Hydraulic filters are current and gauge is functional
- Chain oiler tank is full and operates correctly
- Hydraulic hoses are secured properly
- Gearcase oil level is correct
- Safety shields in place
- Spinner Assy moves through full range of operation
- Spinner discs and fins installed properly
- Spinner discs and fins are in acceptable condition
- Material Divider assembly is square and secure
- Material Divider is clean of build-up
- Feedgate assembly is level
- Encoder installed and secured
- Spinner sensor adjusted to proper gap

Start engine/Start and run to operational temperatures

- Hydraulic fittings are tight, no leaks *
- Check operation of all alarms
- Hydraulic flow test: ____GPM @ operating engine RPM
- Check main relief valve setting : _____ PSI
- Conveyor control valve is operating correctly
- Calibrate radar/ground speed input
- Test maximum conveyor(s) RPM
- Test right and left hand spinner speed; ensure difference is less than 30 RPM (when at operating RPM)

Stop operation/Turn off engine and engage parking brake

- Visually check for leaks
- Check belt/chain tension and alignment
- All oil levels full

Perform Calibrations

- Product density testing, crush strength, and SGN scale (See Spread Pattern Calibration section for instructions).
- Catch tests of all products and at least 1 blend for conveyor calibration and document settings and product characteristics
- Spread pattern tests of all products and at least 1 blend and document settings and product characteristics

End of Season

- Empty unit of all material
- Sand and touch-up paint as necessary
- Wash chain conveyor, lubricate thoroughly when dry
- Check spinner discs and fins for wear
- Clean unit inside and out
- Check for leaks
- Lubricate all grease fittings
- Ensure all fasteners are secure and properly torqued

Introduction

ISOBUS is a protocol standardizing communication between chassis, displays, farm management software, and implements. Adhering to ISO 11783 standards, ISOBUS allows chassis and implements of different colors to share information through a common display. The use of ISOBUS technology allows the end user to minimize the number of necessary monitors in the cab of the chassis, while still enabling full functionality of the implements. The data displays the same way on any monitor.

How the ISOBUS Works

The BUS is a distinct set of conductors designed to carry data and control signals within a system of parallel connected equipment. Information from the equipment modules is transmitted through the BUS to a Virtual Terminal (VT) in the cab. The Virtual Terminal (VT) uploads a User Interface (UI) which feeds into any Display Monitor. From one Display Monitor, the user can read information and make control changes to the implement(s). Since everything is virtual, multiple implements can be controlled with one monitor by switching back and forth between different VT's.

Terminologies

- ISOBUS - An electronic communications network used on agricultural and forestry equipment that adheres to the ISO 11783 standards.
- VT (Virtual Terminal) - The electronic interface that resides within the system, rather than on the Display Monitor. By being virtual, the information will display consistently the same on any monitor being used.
- UI (User Interface) - The displayed information and controls the user interacts with on the Display Monitor to make any necessary changes to implement performance.
- ECU (Electronic Control Unit) - New Leader module that controls specific functions of the implement and is attached to the BUS.
- Task Controller - A crucial software component that resides within the Virtual Terminal and is required to provide support for Data Logging, Variable rate application via prescription maps, and on/off implement section control via AutoSwath.
- CANBUS - A CAN (Controller Area Network) BUS system is a vehicle bus standard that allows microcontrollers and devices to communicate with each other within a vehicle without a host computer.
- Display Monitor - The physical monitor used in the cab that communicates with the VT to run the implement(s) and display data from the operations.

Controller Operations

Requirements

System Requirements:

• Virtual Terminal version 3 that supports AUX-N functionality
• Task Control (Multi-product up to 4 bins)

  • TC-BAS
  • TC-GEO
  • TC-SC

Function:

• VT will load New Leader UI and assign functions to in-cab switches.

  • Ability to track totals.
  • Ability to log as-applied maps and load prescription maps.
  • Ability to activate section control or AutoSwath.
Navigation

To activate the New Leader Controller Interface, power up the monitor and activate the VT settings. For instructions on how to activate the VT, see the Manufacturer’s Operations Manual for the specific monitor being used.

Activation of VT will bring up the New Leader Home Screen, also called the “Run Screen”, as shown in Figure 1.

![Figure 1 - Home Screen](image)

| A | Spreader Operations |
| B | Density |
| C | Speed Source |
| D | Target Rate |
| E | Actual Rate |
| F | Increase Rate Value |
| G | Run Screen |
| H | Decrease Rate Value |
| J | Settings |

| K | Target Rate 1 |
| L | Calibration |
| M | Target Rate 2 |
| N | Diagnostics |
| P | Manual Conveyor Mode |
| Q | Tools |
| R | Bin/Gate settings |
| S | Spinner Settings |
| T | Bin Selection |

![Figure 2 - New Leader Home Screen](image)
An on-screen Numeric Keypad is made available for changing configuration settings and calibration numbers. Press the keypad button to access the on-screen numeric entry screen. Keypads may look different depending on VT being used.

**Navigation Control Buttons**

- Back Button
- Forward Button
- Return to Previous Screen
- Accept Entry
- Cancel
Controller Operations

Machine Configuration

NOTE: Refer to default settings table at end of controller section for factory setup defaults.

NOTE: Before use, Display Monitor must be setup to enable VT connection and a machine configuration may need to be built. See Manufacturer's Operations Manual for detailed instructions on these processes.

Initial Configuration/Factory Setup

(Only seen on first boot, or if system is reset/reconfigured)

• Power up Display Monitor and activate VT.

• Alert screen appears identifying that system is not configured. Press \(\checkmark\) to continue.

Overview of attached modules:

• Number of spreader modules will be shown along with any add on modules. Press \(\checkmark\) to continue.
Enable Installed Bins

- Enable all bins that are installed on the unit by pressing the button next to each. A \( \square \) will appear next to enabled bins as shown. Press \( \square \) to continue.

Bin Settings

Bin settings include Name, Capacity, Bin Sensor, Feedgate enabled/disabled, and Pressure Transducer calibration.

- Enter Capacity for Main Bin using keypad. Enable or disable bin level sensor as required. Press \( \square \) to edit pressure transducer settings. If standard transducers are being used, press \( \square \) to continue.

- Enable transducers and set calibration settings as necessary (adjust only if standard HECO provided transducers are not being used). Press \( \square \) to continue.

- Repeat step 3 for MultiApplier or MultiBin Bin 2 as necessary. Press \( \square \) to continue.
• Repeat step 3 for MultiBin Micro 1 as necessary. Press to continue.

• Repeat step 3 for MultiBin Micro 2 as necessary. Press to continue.
**GPS Offsets**

Editing the task controller GPS offset settings will determine drop point of material behind chassis.

- Select Towed or Self Propelled and enter GPS Offset using keypad.
- For single axle towed units, enter the distance from the center of the hitch pin to the center of the axle (a). Then enter the distance from the center of the axle to the center of the spinner disc (b).
- For self-propelled units, enter the distance from the center of the rear axle to the center of the spinner disc (a).
- NOTE: For units and trailers with tandem axles, use the center of the tandem for measurement reference point.
- Press to continue.

**System Setup Summary**

- Verify all settings are correct. Press to continue or to go back and adjust as necessary.

**Configuring Auxiliary Switches**

- Switches must be configured before calibration.
- Switchbox switches need to be mapped. Use the Display Monitor’s operations manual to map all switches as necessary.
**Settings**

Changing machine calibrations allows operator to enable/disable bins, adjust valve calibration numbers, change alarm settings and reset modules. On the Home Screen, press \(\text{Profile Management}\) to change these settings:

Press \(\text{Profile Management}\) to enable/disable bins.

### Enable/Disable Bins

- Each Installed Bin (as set up in Step 4) will appear. Press each “Enable” button to enable or disable each bin as appropriate for the current job.

### Valve Calibration Adjustment

- Press \(\text{Control Valve Settings}\) to adjust valve calibration numbers.

**NOTE:** Default values are not fine tuned and may result in a slower response time than desired. Adjust at first time start up and when valve is replaced.
• Press \[ \text{button} \] to set spinners. Enter appropriate settings:
  • PWM Valve settings:
    • “Monitor” - no PWM control
    • “Control” - tries to maintain spinner speed at all times regardless of available hydraulic flow. Best for hydrostatic or CVT drives.
    • “Hold” - Preserves last PWM signal to valve when conveyor is deactivated. Best for geared transmissions with gear pumps.

• PWM Frequency - Frequency that PWM control valve is pulsed at. Settings can be found from valve manufacturer.
• Zero Flow Offset - Represents maximum duty cycle sent to control valve without producing any hydraulic flow from. Increase this number to hit target rate sooner.

**IMPORTANT!** Setting Zero Flow Offset too high will cause spinners to overshoot Low Spinner Speeds and could cause delay in reaching set speed. Adjust as needed in small increments.

• PWM Gain - Determines how aggressively control valve responds when making rate adjustments. Higher value means more aggressive system response.

**IMPORTANT!** Setting PWM Gain too high spinners will become erratic. Adjust as needed in small increments.

• Set Conveyors by selecting each bin at bottom of screen.

**NOTE:** If using PWM valves instead of Servo valved, select “PWM” from “Control Valve Type” list and enter settings as per notes on Spinner valves and test for accuracy.

**NOTE:** Setting value too low can cause product control system to continually hunt for target application rate. Setting too high will cause excessive product application error and a delay in target rate being reached.
Enter appropriate settings:

- **Valve Response 1** - Determines speed of servo valve when product control error exceeds Response Threshold setting. Represents fast speed of servo valve. Decreasing value will cause servo valve to run slower. Default setting is 40%.

- **Valve Response 2** - Determines speed of servo valve when product control error is less than Response Threshold setting. Represents slow speed of servo valve. Decreasing value causes servo valve to run slower. Default setting is 8%.

- **Response Threshold** - Determines where control channel switches between using Valve Response 1 and Valve Response 2 speed setting. Leaving all other valve control settings at default value and making small adjustments to this setting is usually all that is required to fine-tune system performance. Default setting is 4.

**NOTE:** Decreasing Response Threshold value will have overall effect of speeding up servo valve response. Increasing Response Threshold value will have overall effect of slowing servo valve response.

- **Allowable Error** - Determines the percent of error that is allowed prior to product control system making any flow rate changes. 2% - 3% is normal dead band setting range.

### Alarm Settings

- **Press** ![Alarm Settings](image) **to adjust alarm settings.**

- **Edit each Alarm setting as desired.**
Reconfigure System

NOTICE! Pressing “Reset” under “System Settings will restore all settings to factory default and all calibration numbers will be lost. It should only be pressed if instructed to do so by service technician or New Leader product support.

- Press **System Settings** to reset/reconfigure system.

- “Reconfigure” allows the user to adjust any of the system settings made during first time start up (“Machine Configuration” steps). “Reset” will restore all settings to factory default and all calibration numbers will be lost.

- Display will then jump to GPS offset screen. See “GPS Offsets” in this section for details.
Switch Assignment

- Press to show connected devices.

- Connected devices will appear in the device list.

- If using a New Leader switch box, press to automatically map the switches to the correct function.
Controller Operations

Material Profile Management

For every material to be spread, at every unique rate, a material profile must be configured. On the Home Screen, press \( \text{Profile Management} \) to manage profiles.

**NOTE:** Spread pattern testing is required when creating a new profile or if modifying an existing profile. A spread pattern test kit is available for this purpose. See “Spread Pattern” section of manual for details.

- Press \( \text{Profile Management} \) to continue.

- Select Swath Module tab at bottom of the screen.

- This screen shows where profiles are stored. Up to 25 different profiles may be saved.
  - Press \( \text{A} \) to create a new profile.
  - Press \( \text{B} \) to edit an existing profile.
  - Press \( \text{C} \) to delete an existing profile.
  - Press the dropdown arrow \( \text{D} \) to select a saved profile.
Creating a New Profile

**NOTE:** When creating a new profile for a new material to be spread, spread pattern tests must be conducted. Spread pattern testing at low and average application rates ensures proper spinner position for given spreader output. Refer to “Spread Pattern” section of manual for details.

- Press on the Swath Module tab under Profile Management to create a new profile.
- Activate bins to be run on profile by selecting the icons on the display.
- Press to continue.

- Enter material density for each bin. crush strength and SGN are not required, but it is recommended to add the information if proper measurement tools are available.
- Press to continue.

**NOTE:** A crush strength and SGN test kit is available. See “Spread Pattern” section of manual for details.

- Enter spinner speed, application speed (ground speed) and desired swath width.

**NOTE:** Spinner speed and swath width are determined from crush strength and SGN. See “Spread Pattern” section of manual for details.

- Press to continue.
Controller Operations

- Enter the minimum rate to be used for Min Rate.
- Enter the average between the minimum rate and maximum rate to be used for Avg Rate.
- Repeat for each active bin.

**NOTE:** Feedgate Optimizer will suggest a new gate height if desired application rate is not possible with current gate height.

- Press to continue.

- Press to start spread pattern test at lowest entered rate.
- Press to continue.

- Enter starting spinner speed, spinner assembly fore/aft scale position and desired swath width.
  - Turn on spinners and drive through the test course.
  - Collect and analyze spread pattern test results from pans.
  - Make adjustments and repeat test as necessary to achieve desired results.
  - Press once an acceptable spread pattern has been achieved.

- Press to start spread pattern test at the average rate.
- Press to continue.
Controller Operations

- Enter starting spinner speed, spinner assembly fore/aft scale position and desired swath width.
  - Turn on spinners and drive through the test course.
  - Collect and analyze spread pattern test results from pans.
  - Make adjustments and repeat test as necessary to achieve desired results.
  - Press \( \checkmark \) once an acceptable spread pattern has been achieved.

- Material profile is now successfully calibrated for low and high rates. Press \( \checkmark \) to continue.

- The next screen displays a summary of the test results for each active bin. Press \( \checkmark \) to continue.

- Enter name for new profile, and any desired notes. Press \( \checkmark \) to continue.
Controller Operations

- Press the dropdown arrow to select desired profile.
- Select desired profile from the dropdown list.
- Press to set selected profile.
- Press

- Active profile is displayed below the swath display below Spinner Settings on the Run Screen.
This page is intentionally left blank.
Component Calibration

NOTE: Before regular use, system must be calibrated to ensure accurate spreading.

- Power up Display Monitor and activate VT.
- The Run screen will appear. Press to continue.

Spinner Disc Calibration

- Press to calibrate spinner discs.

- Use keypad to edit numeric setting as necessary:
  - Standard spinner discs, set to 4.
  - If using 5 fin discs, set to 5.
  - If using 6 fin discs, set to 6.
  - Press to accept change and continue,
  - or to cancel.
Spinner Assembly Calibration

The spinner assembly must be calibrated if either the fore/aft or left right cylinders are replaced, or if a new swath module is installed.

- Press ![Spinner Assembly](image) to calibrate spinner assembly.

![WARNING](image)

Spinner assembly will move during calibration process. Keep away from moving parts to avoid injury.

- Press ![Checkmark](image) to begin calibration process.

- Spinner assembly will move through range of motion both fore/aft and left/right. Press ![Checkmark](image) when complete.
Feedgate Calibration

1. Press \textbf{gate height} to calibrate feedgate height.

2. List will appear with all installed feedgates. Select feedgate to calibrate.

3. The feedgate will move to its lowest possible height. Press \checkmark to continue.

4. Measure the actual height of the feedgate above the conveyor as shown by measurement A. Bin 1 feedgate with insert shown.
5. Enter the actual measured height of the feedgate in the display. Press to continue.

6. The feedgate will now move to its maximum height. Press to continue.

7. Measure the actual height of the feedgate from the conveyor as shown by measurement B.

   NOTE: Maximum height setting of feedgate is higher than actual feedgate opening. Ensure measurement taken is from the bottom edge of the feedgate to the conveyor.

8. Enter the actual measured height of the feedgate in the display. Press to continue.
9. Measure the height of the actual feedgate opening from the conveyor as shown by measurement C.

10. Enter the measured height of the feedgate opening into the display. Press ✓ to continue.

11. Repeat steps 2 - 10 for all installed feedgates.
Controller Operations

Conveyor Calibration

**IMPORTANT!**

For best results, a catch test must be done for each product to be spread before season begins, or any time a new supply of product is received.

- Press **Conveyor** to calibrate conveyor.
- Manually enter cubic feet per revolution (CFR) rate using keypad.
- To begin catch test, press **Static Routine** for the bin to be tested.
- To perform in-field calibration, press **Field Routine** for the bin to be tested.

**WARNING**

Do not work near rotating spinners. Severe injury can result from contact with moving parts.

- Spinners will automatically shut off. For added safety, disconnect PWM valves. Press **✓** to continue.
- Verify Feed Gate Height and Product Density are correct. Use keypad to edit as needed. Enter Dispense Amount using keypad. Press **✓** to continue.
- Bring engine up to full operating RPM.
Controller Operations

- Using the control buttons (Reset, Run, Stop), run a catch test. If spreading product that has already been tested, press to continue. To begin a test, press . Conveyor will run.

- Once controller dispenses specific amount, conveyor will stop. Press to continue.

- Weigh material dispensed and enter actual weight of material dispensed. Press to continue.

- It is recommended a minimum of three (3) tests be done PER PRODUCT to ensure accuracy. Once each test is done, press “Repeat Calibration” to run a subsequent test. When finished, press .

- The main Calibration screen will appear. To calibrate with a known amount brought to a field, press .

**Note:** Field totals can be reset from Summary Screen if needed.
• After dispensing product in field, screen displays system perceived total of dispensed product. To enter actual dispensed amount, press .

• Using keypad, enter actual weight of product dispensed. Press to continue.

• New cubic feet per revolution (CFR) rate will be displayed. Press when finished.
Operations/Features

Create New Job

The following is a guide for running system for first time.

1. Create Job in display.

This operation will vary from display to display. Refer to display manual on how to create a job using Task Control. When finished, activate VT.

Material Density will vary from product to product. It is imperative that correct density is entered in controller for rates to come out correctly.

- To change product density, press

- Use keypad to enter density. Press to accept change and continue, or to cancel.
3. Verify task control in Target Rate 1.
   - Rate will be driven by job setup in display. To verify this, TC should show in place of target rate 1. If not, verify job has been created correctly. Refer to display manual.

4. Verify total spread width and spinner speed:
   - Different products may require different spread widths or spinner speeds. Always verify the material profile is configured correctly before applying product.
   - Edit current profile or create a new one if necessary. See “Material Profile Management” for details.

   • Enable Spinner Circuit. Using keypads, enter Spinner Speed and Total Spread Width. If desired, enter Spinner Offset (see Boundary Spreading section of this manual for instructions).

5. Verify gate opening:
   - Press to set bin levels and change gate opening.
• Use keypad to set feedgate opening to correct reading.

6. Verify CFR number is correct:

Different products may require different calibration numbers. Verify the CFR number is correct before applying product.

• Press then .

• Use keypad to change CFR number as needed.
Feedgate Optimizer

**NOTE:** This program will help to determine the ideal gate position for each specific application, based on speed, swath width, density, and application rate.

1. Power up Display Monitor and activate VT.
   - The Run screen will appear. Select appropriate bin button at bottom of screen. Press to continue.

   ![Run Screen](image1)

   ![Bin Events Screen](image2)

2. Enter average speed and target rate:
   - The Feedgate Optimizer screen will appear. Using keypads, enter Average Speed and Target Rate into appropriate fields for each bin.

   ![Feedgate Optimizer Screen](image3)

3. Accept recommended settings:
   - Recommended feedgate opening will be displayed along with minimum and maximum rates. If is selected, new feedgate setting will save and automatically move to proper height. If is selected, new settings are ignored and system settings are kept.

   ![Accept Settings Screen](image4)
Boundary Spreading

NOTE: This program allows the operator to independently modify spinner speeds to change the width of spread to either side, creating a “boundary” line to maximize spreading efficiency.

- On the Run Screen, press  to access spinner settings.

1. Enter spinner offset:
   - The Spinner Settings screen will appear. To create a Boundary, use the keypad to enter a specific Spinner Offset. Spread pattern tests should be completed for each product to be spread to determine best offset settings, based on density, crush strength and size. See “Spread Pattern” section for details. Press to save and return.

2. Enable boundary spreading:
   - When running normally, Run Screen will display all swath sections normally. To activate the Boundary, flip the spinner switch on the switch box to the side that the boundary is on.
   - EXAMPLE: If spreading with a boundary to the right hand side in relation to direction of travel, flip the switch to the right to limit the spread pattern on the right hand side.
Remote Spreading

NOTE: This program allows the operator to shift the spinner assembly left or right to apply a near “half pattern” with the majority of the pattern on one side of the machine only.

- On the run screen, press [ ] to access spinner settings.

- Select the check box for the side of remote pattern desired.

  EXAMPLE: To apply product on only the left hand side in relation to the direction of travel, select the left hand check box to activate left-hand side only remote spreading.
Diagnostics

**NOTE:** Advanced diagnostic features are available that allow the operator to quickly diagnose most issues that could occur.

1. Power up Display Monitor and activate VT.
   - The Run screen will appear. Press to continue.
   - The Diagnostics screen will appear. Press to view Bin Diagnostics.
   - Diagnostic information for each bin will display (these are used for troubleshooting). Press to return to Diagnostics screen.
• To view machine lifetimes totals, press **Lifetime Totals**.

• At top of screen, each bin’s lifetime totals for acres and weight appears. At bottom of screen, cumulative Acres(ac) and Weight(lbs) will appear. Hours(hrs) will be on main bin only. Press **Lifetime Totals** to return to Diagnostics screen.

• To view active alarms, press **Alarms**.

• Current active alarms will display. When an alarm code is highlighted, a description will appear at bottom of screen. This is used for troubleshooting. Press **Alarms** to return to Diagnostics screen.
• To view unlocked features, press Unlock.

• Current unlocked features will display. Press “Unlock” to display module serial number and registration number. Press to return.
Controller Operations

Hydraulics

NOTE: This program will show a visual representation of hydraulic monitoring, including system pressure, temperature, conveyor pressure, and indicators for low fluid level and filter restriction. Individual bins can be viewed by pressing the bin icons along the bottom of the screen.

1. Power up Display Monitor and activate VT.
   • The Run screen will appear. Press to continue.

   • The Tools main screen will appear. Press to continue.

2. View hydraulic monitoring:
   • Hydraulics - System pressure, Temperature, and status of Fluid Level and Filter Restrictions will show system wide.
   • Conveyor Pressure will display for Bin 1, and cumulatively for Bins 2 - 4 as equipped.
   • Fluid Level and Filter Restriction status are shown in the lower right hand corner. When within acceptable levels, the boxes are outlined in green and display a (as shown). If fluid level is low or if filter is restricted, the box will be outlined in red and display a
   • Press to return to Tools Screen.

NOTE: If the spreader does not have an onboard hydraulic reservoir, fluid temperature, fluid level and filter restriction are not accurately displayed.
Controller Operations

Cylinder Bleeding

Bleeding routine is run to purge air from hydraulic cylinders for accurate positioning. Perform the bleeding routine at the beginning of each season, after any service work has been performed on the hydraulic system, and upon startup if spreader has been sitting for an extended period of time.

- Press \( \text{to access cylinder bleed routine.} \)

- The Tools main screen will appear. Press \( \text{to continue.} \)

\[ \text{WARNING} \] Spinner assembly and feedgate(s) will move during calibration process. Keep away from moving parts to avoid injury.

- Press \( \text{to begin bleed routine.} \)
**Controller Operations**

**Bin Flush**

**NOTE:** This program is used to quickly empty each bin. Spinners will automatically shut off and allow the operator to select which bins to empty.

1. Power up Display Monitor and activate VT.
   - The Run screen will appear. Press to continue.

   ![Run Screen](image1)

   ![Tools Screen](image2)

   ![Disable Spinners](image3)

   ![Warning](image4)

   **WARNING** Do not work near rotating spinners. Severe injury can result from contact with moving parts.

   ![Warning](image5)

   **WARNING** For added safety, unplug PWM valves to ensure spinners cannot run while in Bin Flush mode to avoid injury.

   - Bin Flush will automatically disable spinners. Press to continue.
2. Select bins:
   • Select bins to be flushed by pressing enable buttons next to each. To adjust conveyor RPM for flush, press [button]

3. Set conveyor RPM:
   • Use keypads to set conveyor RPM for each bin. 20 RPM is default.
     • Bin 1 Maximum = 50 RPM
     • Bin 2 Maximum = 60 RPM
     • Bins 3 & 4 Maximum = 85 RPM
   Press [button] to continue.

4. Perform bin flush:
   • To flush bins, press [button]. Conveyors will run until [button] is pressed.

   When process completes, press [button] to continue.

   **WARNING**
   Do not work near rotating spinners. Severe injury can result from contact with moving parts.

   • When exiting Bin Flush process, spinners will restart. Plug PWM valves back in if it was previously disabled. Press [button] to continue.
Controller Operations

Body Module

1. Power up Display Monitor and activate VT.
   - The Run screen will appear. Press [ ] to continue.

   - The Tools main screen will appear. Press [ ] to continue.

Bin Cover Control

- If equipped, press [ ] (A) to open and close tarp.
- If MultiBin insert is installed, press [ ] (B) to open and close Micro cover.
Controller Operations

Chain Oiler

**NOTE:** This program is used to manually oil the chain, set alarm frequency, and set auto-lube settings.

1. Power up Display Monitor and activate VT.
   - The Run screen will appear. Press to continue.
   - The Tools main screen will appear. Press to continue.

2. Set duration:
   - Use keypads to set oil chain duration (recommended 1 revolution). Lube routine is not used at this time.
3. Set conveyor dimensions:
   • Press “Dimensions” to input conveyor dimensions. Use keypads to input conveyor length and sprocket diameter.

   Press 🔄 to return to Chain Oiler screen.

   Press 🔄 to return to Tools Screen.

4. Set service reminder:
   • Press “Service Reminder” to set chain oiler reminder. Enable Reminder and use keypad to enter interval hours desired. To restart reminder after manually oiling conveyor, press 🔄.

   Press 🔄 to return to Chain Oiler Screen.
Controller Operations

Bin Sequencing

NOTE: This function allows the operator to run same product out of two bins, chaining them together so bin 2 starts emptying immediately after bin 1 is empty.

1. Power up Display Monitor and activate VT.

   • The Run screen will appear. Press \( \text{Run} \) to continue.

   • The Tools main screen will appear. Press \( \text{Profile Management} \) to continue.

   • Press the Bin Chaining tab at the bottom of the screen to continue.
2. Setup Bin Sequencing (Chaining):
   A. Enable bin chaining for Bins 1 & 2, or Bins 3 & 4 as applicable.
   B. Select trigger type (Manual Only, Low Bin Threshold, Low Bin Sensor, Container Reaches 0).
   C. Select which bin to empty first by pressing arrow button until arrow points to second bin to empty. Figure at right shows Insert Bin emptying first and Main Bin second; Micro Bin 2 emptying first and Micro Bin 1 second.

Press [ ] to continue.

3. To manually switch bins:
   • When Bin Sequencing is enabled, Manual Override button appears on Run Screen to force switch over to next bin.

A Catch Test is required prior to each season, before using a new product, or if a significant visible change has occurred with a product.

**Catch Test**

The CFR number, or cubic feet per revolution number, is a calibration number entered into the controller to determine rate output from the spreader’s conveyor. A catch test is performed to verify accurate rate output per the controller.

**WARNING**

Use great caution while working around the spreader. Contact with spinners and other moving parts is very dangerous. Do not adjust while machinery is moving, wear eye protection and avoid discharge from spinners. Do not ride on moving spreader.

NOTE: An optional calibration chute (P/N 312688) is available to simplify the catch test process. The calibration chute fits all New Leader spreader models with 30” wide conveyor bottoms. Contact your local New Leader dealer for details.

**WARNING**

To prevent injury, disable the spinners by unplugging the PWM valve before beginning the catch test procedure.

1. Disable the spinners by unplugging the PWM valve(s).
2. Move the spinner assembly to the 4” (102mm) position.
3. Remove the Material Divider back plate, and Vane Assembly (if applicable). Install calibration chute if available.
4. Position an end loader or other suitable device beneath the spinners to catch material.
5. Load material into all applicable bins.
6. Prime the conveyor as specified per the controller.
   - If using a calibration chute, run the conveyor just until material reaches the end. Remove any excess material that falls into the catching device.
   - If not using a calibration chute, run the conveyor until the spinner discs are full of material. Remove any excess product from the catching device. Do not remove material from spinner discs.
7. Measure the depth of material on the end of the conveyor to verify the constant number feedgate height information entered into the controller. Adjust feedgate height or recalibrate feedgate as necessary.
8. Verify that all other product settings entered into the controller are correct.
9. Select the correct bin in the controller for the first bin to be tested. Enter the anticipated weight of product to be dispensed from the conveyor.
10. Start the engine and engage hydraulics. Allow to run for several minutes to bring hydraulic oil up to operating temperature. Bring engine up to operating RPM.
11. Following the setup wizard on the controller, run the catch test. The conveyor will start dispensing material, and automatically shut off when the estimated amount of product is dispensed.
12. If not using a calibration chute, leave the material on the spinner discs. Weigh the amount of product that the conveyor actually dispensed into the catching device, and note the result.
13. Enter the actual weight of material dispensed into the controller. The controller will then automatically perform the calibration.
14. Repeat Steps 5 - 12 for all other applicable bins, if an insert bin is installed.
15. Once satisfactory results have been achieved for all applicable bins, turn the engine off, replace the back plate on the Material Divider, return the spinner assembly to its original position setting, and plug the PWM valve(s) back in.

NOTE: For more information on controller operations and setup, contact your local dealer.
WARNING

Use great caution while working around the spreader. Contact with spinners and other moving parts is very dangerous. Do not adjust while machinery is moving, wear eye protection and avoid discharge from spinners. Do not ride on moving spreader.

NOTICE!

Spinner assembly and material divider have NOT been adjusted at the factory. Before spreading material, spread pattern tests must be conducted to properly adjust the spread pattern. A spread pattern test kit is available for this purpose. THE MANUFACTURER OF THIS SPREADER WILL NOT BE HELD LIABLE FOR MISAPPLIED MATERIAL DUE TO AN IMPROPERLY ADJUSTED SPREADER.

Spread Pattern

Product quality will affect spread pattern and product performance. Spread pattern testing is required to ensure proper application of material. Larger products will produce wider swath widths.

Spread pattern is adjusted using one or more of the following:

- Point of material delivery on spinner discs
- Spinner speed
- Angle of the distributor fins on the spinner discs

Since adjustments will vary for each job, trial and experience must be used to determine the adjustments required to obtain the swath width and spread pattern desired.

Spread Pattern Test Kit

Spread Pattern Test Kit, part no. 313960, includes the following:

NOTE: If desired, a material calibration kit is available to aid in measuring product quality. Contact your local dealer for details.
## Spinners

**NOTICE!** Spinner discs and fins must be kept clean and polished. Even a small build-up on a spinner fin can significantly affect the spread pattern. Rusty, rough, bent or worn fins will produce poor spread patterns.

In general, critical spinner speed will fall somewhere between 600 and 900 RPM. Spinner speed is adjusted by changing the settings in the controller. Proper spinner speed adjustment is critical in obtaining optimal spread patterns. The best spinner speed to use will depend entirely on the material being spread, and must be determined by testing.

### Spreader Preparation

The spreader to be tested must be in good mechanical condition and properly adjusted. Refer to operator’s manual for details.

All damaged and worn parts must be replaced. Spinner discs and fins must be free of any material build-up, rust or paint.

Fill the hopper with the material to be spread. Run the material out to the end of the conveyor.

Set the feedgate and the in-cab controller to deliver the required rate per acre. Make sure the feedgate is level and the indicator reflects the actual gate opening measured by standing a tape measure vertically in the material.

**NOTE:** Do not match slope of endgate when making this measurement. Measurement must be perpendicular to conveyor.

Adjust the spinner assembly by turning the crank or, if an actuator is installed, change the setting in the controller. To begin testing, position the spinner according to the chart below.
NOTE: This chart is to be used as a reference only to begin testing.

* 15 mph when using high performance (HP) hydraulics.
Test Procedure

Using the data sheets supplied with the kit, document all spreader information and adjustments as necessary. See Figure 1.

Select an area for testing measuring at least 120 feet x 200 feet (37 m x 61 m), and with a slope of less than two degrees.

All testing should be done when the wind velocity is less than 5 MPH (8.05 km). If wind is present, testing must be done with spreader traveling parallel (within ± 15 degrees) to the wind direction.

Do not allow loaded spreader to sit for more than one hour prior to testing.

At this stage of testing, drive the spreader over the collection trays in ONLY ONE DIRECTION.

Insert a plastic grid into each of the 23 collection trays. Position the blue collection tray in the center of the spreader’s path with the longest dimension of the tray parallel to the direction of travel. Position the first left-hand and right-hand trays 10’ (3m) from center, and all subsequent trays on 5’ (1.5m) centers.
**Four-Wheeled Vehicles**

For four-wheeled application vehicles, position the spreader at the beginning of the course so that the vehicle will straddle the center collection tray. See Figure 2.

Engage spinners before navigating the course. As the vehicle approaches the flag positioned 75’ before the row of collection trays, engage the conveyor(s). Do not shut the conveyor(s) off until the vehicle approaches the second flag.

Drive spreader completely through course at normal operating speeds.

![Figure 2 – Four-Wheeled Vehicles](image)

**Three-Wheeled Vehicles**

For three-wheeled application vehicles, straddling the center tray is not possible. Place the center collection tray beneath the vehicle just behind the front tire when the spreader is in position at the beginning of the course. See Figure 3.

Engage both the spinners and conveyor(s) before navigating the course. Do not shut the conveyor(s) off until the vehicle approaches the second flag.

Drive spreader completely through course at normal operating speeds.

![Figure 3 – Three-Wheeled Vehicles](image)
TEST RESULTS

After navigating the course, shut the spreader down and park in a secure location.

Using the funnel, transfer the contents of each collection tray into its corresponding test tube beginning at one end of the trays and working towards the opposite end.

If spreading a blend of materials, inspect all tubes to determine if the blend is consistent across the entire swath width. If the blend is not consistent, use a narrower swath width. The swath width should be based on the material thrown the shortest distance.

Record each test tube’s volume in the box on the data sheet under the corresponding tray position and graph the spread pattern profile. See Figure 4.

Looking at the material in the test tubes and the graphed profile on the data sheet, compare the overall shape of the spread pattern to the three acceptable patterns, shown in Figure 5. If an acceptable pattern has not been achieved, proceed to “Troubleshooting”. Once an acceptable pattern has been achieved, proceed to “Determining Driving Centers”.

Figure 4

Figure 5 – Acceptable Patterns
## Troubleshooting

NOTE: It is highly recommended that ONLY ONE ADJUSTMENT be made between test samples taken. If more than one adjustment is made, it will be difficult to determine which adjustment was responsible for the change in pattern shape.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Pattern</th>
<th>Recommended Adjustments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heavy Directly Behind the Vehicle</td>
<td><img src="image1" alt="Pattern" /></td>
<td>1. Move the spinner forward (toward the conveyor).</td>
</tr>
<tr>
<td>Light Directly Behind the Vehicle</td>
<td><img src="image2" alt="Pattern" /></td>
<td>1. Move the spinner rearward (away from conveyor).</td>
</tr>
<tr>
<td>Light Outside Vehicle’s Tire Tracks</td>
<td><img src="image3" alt="Pattern" /></td>
<td>1. Check spinner fins for material buildup, rust or paint. &lt;br&gt;2. Increase spinner RPM. &lt;br&gt;3. Move spinner fins to 2 - 3 - 2 - 3 positions. See Figure below.</td>
</tr>
<tr>
<td>Pattern Off Center</td>
<td><img src="image4" alt="Pattern" /></td>
<td>1. Check to see feedgate is level and free of caked material. &lt;br&gt;2. Make sure hillside divider spinner assembly and material divider are mounted squarely and centered. &lt;br&gt;3. Testing should be done parallel to wind.</td>
</tr>
</tbody>
</table>

![Figure 6](image5)

Figure 6

Spinner fins are adjustable to radial angle as shown in Figure 7. Refer to Figure 6 for fin adjustment recommendations.

![Figure 7 - Spinner Fin Adjustment](image6)
DETERMINING DRIVING CENTERS

Once an acceptable pattern is obtained, as shown in Figure 5, driving centers can be determined. To determine optimum driving centers (effective swath width), determine the average amount of material in the center of the pattern. Figure 8 shows an example data sheet recorded from the profile shown in Figure 9. Based on the example, the average amount of material in the center of the pattern is 3.0, as indicated with the red dotted line.

Next, locate the points on both the left and right side of the pattern where the amount of material is half the average amount at the center of the pattern. In the example shown in Figure 8, these points are located 45’ to the left of center, and 45’ to the right of center. The distance between these two points (90’) represents the driving centers to use.

NOTE: Once the effective swath width has been established, a change in the controller may be required.
Verifying Driving Centers

Once optimum driving centers (effective swath width) have been established, conduct a final “S” pass over the trays to verify. Refer to Figure 10.

1. With both the spinners and conveyor turned off, drive the spreader through the center of the course, establishing an “AB” line. If the spreader vehicle is a three-wheel type, remove the center pan.

2. Line the vehicle up with either end of the row of collection trays, at a distance from the “AB” line equal to the effective swath width.

3. With both the spinner and conveyor engaged, drive past the trays.

4. Switch back and drive over the center of the trays, down the “AB” line.

5. Drive through the row of trays and switch back once again, driving past the trays on the opposite side, at an equal distance from the “AB” line as the first pass.

If the driving centers were determined correctly, all trays should have a similar amount of material, showing a near flat profile in the test tubes. If the trays near the center of the row contain more material than the others, increase driving centers. If the trays near the center of the row contain less material, decrease driving centers.

NOTE: If spreading a blend of materials, verify blend of all products is consistent across all tubes.
